We (whole family, #1 daughter about to head out to school
halfway across the state next year) figure on using packet
radio to keep in touch during the school year, avoiding
both AT&T bills and U.S. mail service.

Having limited funds, what I'd like to know is if it is
generally possible to connect TNC's to handheld transceivers.

I'm assuming that if it can be done, that I will also expect
to be using something other than the default antenna that
comes with the HT. The computers we already have, too.

Any other warnings would be useful.

     thanks

Well, you could. If you buy the blank TAPR TNC-2 PC board for $30,
you could then a 100% true TNC-2 if you build it out...

Contact TAPR for details...

Dana

If you look on the pc board, you will see that the 1270B has the HF
tuning indicator (and some other circuitry) laid out on the board.
They just don't load the parts on the 1270B model.

Dana Makes a good point about the use of the VHF MVP's for 9600b.
Dana, with the correct mods, one that does include the use of a 10k pot
in line of the input audio, so as to not over-deviate, works great.
Our packetcluster backbone here uses 4 of them, two in lowpower (radio only)
and two in highpower (excess of 400w) and we have had no problems at all.
They have been connected successfully to both the K9NG and G3RUH modems in
either MFJ 1270's or Kantronic DataEngines. The base mod does NOT utilize
the mic jack at all.

About the 70cm radios, they function equally well. The same base mods are used and the same modems are working fine, and have been for the past 2 years on several systems, mine included. The reason that i started the topic of using the MVP is because of its surplus cost, as compared if someone wanted to go out and buy the 250-275 dollar Alinco, which i have heard works great not to mention. Also the fact that the radio is darn near lightning (knock on wood) proof, with a DIRECT hit on two of them in the past, and not so much as a blink from the radios, but the computer stuff did not fare as well!

Overall with the correct mods, the price is right, they're tough as all get go and work pretty darn good!

I was wondering what yall thought of the mfj tnc's. I've asked around here a little and most people here don't seem to like them much. I'm thinking about one because they are cheaper than any of the other new tncs. The main gripe is that they don't connect very well to other makes of tnc's.. if its another mfj then your ok, if not, then you may have problems..

 thanks!

That's right. If the parts aren't there, the circuit isn't there.
No big whoop.

Well NOS will allow you to monitor the channel, including ill formed
packets using the highest level of the trace command. However, if the
transmissions aren't NRZI it's going to be difficult to make sense of
them since the hardware in the TNC is going to treat them as if they
were. The NRZI conversion is done in hardware on a regular TNC. The
Baycom module, with the NOS driver, might do the job with a little
hacking of the driver code.

>Any other warnings would be useful.

If you already have the HTs, you can attempt to use them. But
if you haven't bought radios yet, a regular mobile/base type
of radio would be better. You can pick up suitable VHF radios
at hamfests for as little as $50-$100. Radios like the IC-22A,
KDK144, Motorola Maxar, or GE MVP will work wonderfully well.
Using a well shielded commercial grade mobile rig is really
the best choice, but many people do manage to get HTs to
work for packet.

If you're already stuck with HTs, you can use them if there
are nearby nodes that you can hit. Do use a divorced antenna,
the rubber dummy loads don't get out well, and you will likely
have problems with RF feedback into the TNC due to the close
coupling of the antenna and the TNC to radio cable. Use good
quality shielded cables between the computer, TNC, and radio.
If you're using a laptop that's probably all you need to do.
But if you are using a typical clone PC you're going to have
to do some shielding of the computer and especially the
monitor. Most RFI is generated by the sweep circuits of the
typical Tiawanese or Korean monitor. As a last resort, you
can use a *long* cable to the radio and locate it with the
antenna at a location remote from the computer.

Hello everybody,

Can someone help me getting addresses of packet-radio equipments manufacturers;
Equipments we intend to buy are:
     TNC's allowing KISS mode
     Tranceivers (FM trabceivers or maybe other kinds)
       Antennas

Any help will be greatly appreciated
thank you

Yuk!, Why not sell your 500 and buy half a dozen C-64's if you want to run Digicom. It seems stupid to run C-64 stuff on an Amiga, no matter how good the C-64 stuff is.

I am thinking of buying a new PK900. A friend had one, serial number 15, and i
t pooped out so he returned it and gotsn:14. That one seemed to work fine, but
 he just couldn't make the change from the KAM he was used to so exchanged it f
or a new KAM. I set up the PK900 and had a chance to read part of the manual.
I thought it was a pretty darn large box and the display seemed very busy, hard
 to read at a glance. It looked like it could be confusing with all the "modem
s", some on one port and others on the other port. The AEA software didn't sup
port the PK900 directly yet either. I would be very interested in other commen
ts. If the PK900 is the only tnc you've owned, I still want your comments but
am more interested in experienced user's comments. Thanks in advance. -Joe-

I am still looking for information on thenet or netrom. The from address
was wrong though on the last post. Anyway I have software written which
uses the input capture feature of the hc11 to recieve frames and that is
all fine except that thenet nodes show up as garbage when the software is
in passall mode. Any ideas would be appreciated especially if replys are
sent to mfarley@matcomlab.math.uno.edu rather than the workstation I
happened to be using at the time. N5ZDA mfarley@matcomlab.math.uno.edu

Does anyone know of an anonymous ftp site where I can find the latest
version of SP (software for WA8DED host mode)? Archie struck out on
this.

TIA, Bob

The MFJ1270 was a TNC-2 clone, with a minor change in the circuit board
layout to accomodate a different style of lithium battery, the HF
modem parts and switch, and the TTL outputs.

The 1270B has much more extensive layout changes, since it's the same
circuit boards as it used in the 1274. They just don't stuff the tuning
indicator parts. However, it's still the same unit 90%+.

The layout changes between the 1270 and the B model are mostly that the
ROM and RAM were swung around onto a previous-empty portion of the
circuit board to make room for the tuning indicator.

To comment on several discussions in packet-radio digest #65:

Regarding the MFJ 1270B - Yes it is a TNC-2 clone with some changes to
the circuit board to add the ability to switch between 1200 baud and 300
baud modems. I didn't look recently, but I remember that the tuning
indicator circuitry of the 1274 is on a daughterboard that plugs into the
main board. The battery layout is slightly different and permits use of
an easily-obtainable battery.

TAPR firmware can be used if you don't want the mailbox. Also WA8DED and
dedicated KISS eproms are available from TAPR. From the recent MFJ ads
it looks like there are some hardware mods which have been added to
expand the mailbox memory. The ads also say "true DCD for HF", which would

seem to imply the TAPR 2211 DCD mods have been incorporated (these help
VHF as well, in those cases where unsquelched receiver noise triggers the
DCD -- not nearly as much of a problem as with 3105 or 7910 modems).

Unless PacComm still has TNC-200s, which I doubt, the 1270B is the
closest thing to a "true TAPR TNC-2 clone" available as an assembled
unit.

A reasonable start-up cost would be $150 for a TNC, and $250 for a
HT. People who can solder and prowl the used-gear market can easily
get in for < $100. However, if you and your daughter aren't
interested in packet as a hobby it's a lot of work and expense just
to avoid picking up a telephone....

> Having limited funds, what I'd like to know is if it is
> generally possible to connect TNC's to handheld transceivers.

Yes. However, you usually have to build a simple circuit involving
a capacitor and resistor to go in the line between the modem and
transceiver. TNC's usually come with explicit interfacing instructions
for the major HT brands.
>
> I'm assuming that if it can be done, that I will also expect

I can reach a local BBS with my rubber duckie, and indoors to boot.
The ARRL's "Now You're Talking" novice/tech license book describes
a 1/4 wave antenna that's easy to make.

> Any other warnings would be useful.

Don't forget to have your daughter check out antenna restrictions with
prospective landlords.

A couple of weeks ago I passed by Tech exam. In the interim while waiting
for my license to arrive I am doing two things: improving my code skill so
I can pass the code test; determining where I want to start in this hobby.

I have decided that I would like to get into packet radio. I intend to
start inexpensively just to be sure that I am going to enjoy this.

I am thinking of getting an ICOM IC 229H and power supply to use in base
mode. I have an old 286 with 1MB regular mem and 2MB expanded mem. I now
have to turn my attention to the TNC. I have two requirements: it not

cost a fortune; it be able to handle KISS so I can try TCP/IP networking.

I would like a TNC that has a good mouse-aware software system to go with it. Does the AEA multi-mode TNC meet these requirements? Where can I buy a good version of the TCP/IP software to use with packet.

Any comments people can send me to help ensure that I get a good start would be appreciated. One of the "advantages" of the delay in being able to get started is the time that can be spent gathering information.

thanks,

Erich

Here's what I know about cheap packet systems:

As I understand it:

1. The BAYPAC (model BP-1) (page 140 November 1992 QST, or page 83 November 73, $50) is a small modem that draws its power from the serial interface. It must be very similar to the TCM3105.ZIP schematic. (Also see BAYPAC review in December 1992 73)

2. It is just a modem, and therefore requires some software like BAYCOM running on a PC-compatible to complete the "TNC" system. The BAYCOM system was reviewed in the December 1991 issue of 73.

Summary of Inexpensive 2m Packet Systems:
---

1. For PC-compatibles:

   A. Poor Man's Packet: (the authors are on internet)
      I. Page 8 August 1991 73 magazine.
      II. Anonymous FTP: helios.tn.cornell.edu (128.84.241.2), /pub/PMP/pmp11dsk.zip (includes executables and source).

   B. BayCom revision 1.50a software and either BAYPAC or use the TCM3105.ZIP Postscript schematic:
      I. Review: December 1991 issue of 73.
      II. Anonymous FTP: WSMR-SIMTEL20.ARMY.MIL (192.88.110.20) or
          mirror sites like OAK.Oakland.Edu (141.210.10.117)
          wuarchive.wustl.edu (128.252.135.4)
          ftp.uu.net (137.39.1.9)
          nic.funet.fi (128.214.6.100)
          src.doc.ic.ac.uk (146.169.3.7)
          archie.au (139.130.4.6).

          I have used wuarchive.wustl.edu (128.252.135.4):
          /mirrors/msdos/packet/tcm3105.zip and

/mirrors/msdos/packet/baycom15.zip
(=BayCom revision 1.50)

The later revision 1.50a is available from ucsd.edu :
/hamradio/packet/baycom/baycom15.zip (168789 bytes)
and also an ENGLISH manual for rev 1.2:
/hamradio/packet/baycom/manual.zip (42424 bytes)

Note: Some older versions of the tcm3105.zip schematic
have 2 R2s. I think the "R2" connected to the
CTS line should be corrected to R3, a 2.2K ohm.

2. For Macintosh:
PacketMac Modem:
Page 8 October 1992 73, and errata page 54 November 1992 73.
(the author's listed internet email (Francis4@apple.com) did
not work, 2-24-93)

3. Commodore 64: I was told:
> Digicom 64 in the August 1986 73 (date ??).
>
> The software is public domain and is usually bundled with a
> "kit," PCB, hard-to-find parts, etc.; from some hams that
> translated the original documentation from the German.
>
> A more-or-less accurate list of the guys that can supply the kit
> is listed in the ARRL publication, "Gateway to Packet Radio."

Notes:
---

1. I have only used Poor Man's Packet, but hope to try BayCom soon.

2. If you have Internet mail but not FTP, try the FTP mail server:
send a mail message with the subject "help" and a single message
line "help" to ftpmail@decwrl.dec.com.

3. I have uploaded the "AX.25 Amateur Packet-Radio Link-Layer
Protocol, Version 2.0 October 1984" specification as ax25.doc in
/hamradio/packet/ on ucsd.edu . If you have problems getting the
file, I'll be pleased to email it to you.

4. You may require an 8-bit editor to modify the the Poor Man's
Packet source code, I suggest Microsoft's m editor (came with my C
compiler), or Microsoft Windows 3.1's Notepad editor.

5. I have seen these ads:

BayPac BP-1, "$49.95 + shipping" (73, Jan 1993, p54):
Tigertronics Inc
400 Daily Lane

P.O. Box 5210
Grants Pass, OR 97527

Look for a file with the name "tcm3105.zip". This unpacks to a Post Script
file which is the schematic, and a text file which contains the reference
designators and parts list. I found the file is on wuarchive.wustl.edu in
the directory mirrors/msdos/packet.

How much FM does modulating the ICOM (GE name for temp comp voltage) line
get you? How linear is it?

I investigated this and decided the standard channel element was not
suitable for direct FM in this manner.

~S INTERNET ACCESS PROVIDERS & DIALUP SERVICE

ATTN all you "fire bottle" collectors and curators of antiquated radios.
chasers of DX, and whatever else is out there.
While this doesn't address items like type 80 tubes or 1927 Zenith
Transoceanics, whether Spratley is on the air or if a packet should
be 128 or 12800 bits , this may be of interest to you.

I've seen numerous people ask to be dropped from the the "mailing list"
because they have been "warned" about getting "personnal mail" on their
company provided E-mail accounts. If you want your own Email account
separate from that provided by your office, maybe you need to read this.

jd--k1zat

directory: netinfo
file: internet-access-providers-us.txt
date: December 1992

* *
This file is Chapter 4 of the book "Internet: Getting Started,"
a book that tells what the Internet is and how to join it.
"Internet: Getting Started" will be published by Prentice-Hall
and available in bookstores in early Spring 1993.
* *

CHAPTER 4
SERVICE PROVIDERS

This chapter provides information regarding Internet access providers, the general types of services they provide, and how to contact them. Although some of these providers can help with international connections, Chapter 6 contains more information about many non-U.S. networks and whom to contact for more information about gaining access to them.

This Chapter first lists national providers of network connections, then lists dialup providers, then lists the providers by state.

The information contained here was current as of the publication of this document, and contains information

as complete and accurate as we were able to find. We would appreciate corrections and additions to this chapter. They can be sent online to nisc@nisc.sri.com or in hardcopy to SRI International at the address in the Overview.

Format

Each Provider is listed in the following format:

Provider name
    Contact name (if any)
    Phone number
    Internet e-mail address
    Services:

Those items in italics are listed without an identifier pre-pended (e.g. CERFnet rather than Provider name: CERFnet).

The Services item is used to indicate the general type of service a provider offers. It will usually contain either:

- Network connections
- Dialup e-mail
- Dialup IP

One provider may offer any or all of these services.

These types of access methods are each described in Chapter 2. Sometimes other services may be noted as well. For further details about any service, contact the access provider. This Chapter lists only phone numbers and electronic mail addresses. Complete postal addresses can be found in the alphabetical access provider listing contained in Appendix II.

Important: Providers often offer services in addition to those noted! This book is concerned mainly with highlighting types of Internet access. Most often, providers offer a range of value-added services in addition to initial access options. For example, most

providers also offer access to USENET news.

If a provider is in your area, but seems from this list not to offer the service you desire, definitely contact them to ascertain their current range of services. Providers expand services often, and it is possible that we were unaware of a service.

Many access providers in the US began with support from the National Science Foundation (NSF) with the mission of connecting research and education sites to the NSFNET backbone or with funding from state agencies to fulfill a similar purpose. Some providers retain this as their primary goal and do not provide access to commercial sites. Other such providers have expanded their missions to include more commercial services, so now serve a wider community. All providers charge fees for their services, which has helped blur the distinction between "commercial" and "research"

providers. With a few exceptions, it is generally true that any organization may join any network as long as

it agrees to abide by that network's Acceptable Use Policy. However, it may be the case that a provider listed in this Chapter as serving a particular area may have some restrictions regarding the type of community it wishes to serve.

Note: Access For Individuals

Individuals usually access the Internet via some dialup means. Therefore, if you are looking for access for yourself, start with the section listing Providers Of Dialup Services, but also check listings under your state for other providers that may offer dialup services.

4.1. National Providers of Network Connections

This section lists providers that offer network connections throughout the United States. Network connections means that they will coordinate with you establish a dedicated connection between your host or your local area network to the Internet.

In most cases, these providers are not repeated in Section 4.3, Providers By State. When shopping for an access provider in the United States, therefore, using this section in tandem with the Providers By State section will give you the maximum information from which to make your selection.

Services: Network connections.

4.2. Providers of Dialup Services

This section lists providers that offer dialup connections. This list includes only national dialup access providers and providers that specialize in dialup e-mail services for specific geographic areas. Those providers that offer both network connections and dialup access to a specific region are listed in Section 4.3 rather than here. This is only for the sake of simplicity. This section is provided mainly for easy reference by individuals seeking dialup access to the Internet. If you are such a person, also look in the section that lists providers by area to see if the mid-level or regional network in your area also provides dialup services.

Even though some providers seem to serve smaller, perhaps municipal areas, their services can be accessed via a long distance phone call, or sometimes via a public data network. It is worth contacting them to see how you might use their services.

All of these providers are listed elsewhere in this chapter as well as here. Many national access providers also offer dialup services, so they are listed here and in the previous section. Those dialup e-mail providers that serve specific areas are listed again in Section 4.3 under the state they serve.

Although this section emphasizes dialup access, it is important to recall that most of these providers offer other services as well.

If no Area Served information is listed for the dialup

providers, they serve all of the US and probably provide international dialup connections as well. Contact the provider directly for more information.

Services: Dialup e-mail.

4.3. Providers by State

This section lists providers by state. Many providers serve more than one state, so are listed more than once. Dialup e-mail providers are listed again here for the areas they serve. National access providers are not listed here; see Section 4.1 for more information. It is a good idea to contact both national providers and more regional providers when considering an Internet connection in order to have enough information to make the best selection.

I am thinking about purchasing a DSP unit for packet and other digital work.
Does anyone know when the TAPR DSP board is supposed to be ready? Of the
AEA and LL Grace units now being sold which do you think is better?

Does the AEA unit appear to be well supported? Is it being upgraded with
new modes on a regular basis? Are ROM upgrades required or can the new
modes be loaded via software? Has AEA added doppler compensation for
satellite work yet?

Thanks

You can still (or could as of May last year, when I bought mine)
get the TAPR TNC-2 blank board and build a TNC -2.   Of course,
this implies you can burn EPROMS - and I've yet to find a good
case for the thing. You also get to run all over town looking for
precision resistors. And I think I saved nearly $3 over buying a TNC.
But it was FUN.   And there's no question of compatibility.
  If you leave your computer running all day, you don't need a
mailbox in the TNC, right ?

That's because the author Sigi Kluger, DL1MEN has specifically requested that it NOT be made available via electronic means. DISK copy only. No BBS copies, and no ftp sites.

By the way, Sigi dropped in here last year (an eyeball QSO) and handed me release 6.10 if anyone would like a copy of it.

Send e-mail for more information on disk mailing service.

SP 6.10.04 - 01/23/92

DOCUMENTATION

SP - the professional packet program for IBM AT

SP 6.10 is (c) Copyright 1989-1991 S. Kluger, DL1MEN. All Rights Reserved.

I prohibit the distribution of this file via packet radio or any other electronic means. Violators will be flamed upon.

***** SP and its companion files (except as noted below) are
***** FREEWARE. This means, that you may copy and pass it on
***** to whoever you wish, as long as it is used for AMATEUR RADIO
***** USE ONLY. Please note, however, that considerable programming
***** effort is contained in SP (more than you'd ever be willing to
***** pay for) and that if you regularly use it, I expect you to
***** register with me and send a contribution for support and
***** maintenance. Send your contributions to my address at the
***** end of this file, using a freely converible currency. The
***** suggested amount is DM 60.00.
*****
***** TFPCR and TFPCX are PUBLIC DOMAIN, no strings attached.

NOTE: This document is intended for use with SP 6.10 for the IBM.
CONTRARY to anything else mentioned herein, many features DO NOT apply to the ATARI ST. I no longer support the Atari.

NOTE: The file RELEASE.NTS contains the differences between 6.00 and 6.10 for the german manual. All such information is contained herein and RELEASE.NTS is not applicable!

1 OVERVIEW

SP is a packet radio terminal program for IBM compatibles.

SP is freely copyable as long as the disk is an exact mirror image of the distribution disk. You have the right to alter SP to suit your personal needs but you must not redistribute such changes. This DOC file and the program are not to be introduced into any BBS, whether packet or otherwise. Due to the low volume there will not be a printed english manual. This DOC file is not to be disclosed to german speaking users.

All registered users of SP 6.00 are given the opportunity to receive the source code. SP is written in Borland C (Turbo C 2.0 on the Atari). The source code license costs DM 300.00 or US$ 200.00 or SFR 300.00 or GBP 100.00, and payment must be in one of those four currencies. Do not send money, please request a license agreement which you must fill out and return along with payment.

COMMERCIAL USE OF SP IS PROHIBITED. Commercial licenses are available. SP may only be redistributed in volume with written authorization by the author.

SP is distributed "as is" which means there is no warranty whatsoever attached, neither that it will work with your particular installation nor that it will work at all.

If you have problems you are encouraged to send packet- or paper mail. My packet address is DL1MEN @ OE9XPI.AUT.EU or @DB0KCP.DEU.EU. If you expect an answer to paper mail, do include return postage (german stamps or a $1 bill). I positively dislike IRCs.

The sugegsted donation for SP is DM 60 (US$ 40, GBP 20, SFR 60). Anyone who has paid less or even received a free upgrade should consider the rising cost of everything these days; SP is well worth 10 times its price.

In order to correctly install and operate SP you require a working knowledge of computers beyond those of a beginner. Please consider that before calling for help.

SP requires a TNC2 with WA8DED EPROM. If need be, and only if there is no other way, you may use the program TFPCR.COM in conjunction with a KISS TNC but be warned that this may not be trivial to get working.

A reasonable alternative is a DRSI PC*PA, four of which can be controlled by SP as though they were a single TNC.

An additional alternative, thanks to DG0FT, ex Y51GE, is the program TFPPCX.EXE, which can be used to emulate a TNC using a DIGICOM or BAYCOM modem. It is to be installed just like TFPCR.

I have a friend who's got one of these KPC3 Modems, and is in need of some better software than the software that came with the modem.

Does anyone know of any PD or commercial software that can support either terminal (and file transfers) and BBS services with this type of modem?

Any information is greatly appreciated!

  I recently purchased a Kantronics KPC-3 and would like to upgrade the memory and add the battery-backed clock module. I found an add for SRAM in the back of a recent PC-Magazine issue:

4 Mbit	512k x 8	Pseudo	$30.00
1 Mbit	128k x 8	Real	$18.00
62256LP	32k x 8	100ns	$5.50

  Are these SRAMs the correct chips for the KPC-3 application? If not, what should I be looking for? Also, does anyone know where I can get the clock module and roughly how much it would cost??

  Thanks,
Michael N9BDF gsu0001@uxa.ecn.bgu.edu

Hello All,
     I was just wondering, has anyone converted a cellular phone for high speed duplex packet? I was thinking about this since I have this really nifty cellular phone that could be being used for ham radio instead of a door stop. I'm sure that it would be different for every phone and some are almost certainly not even suitable for use this far out of band. If anyone has used or tried to use a cell-phone for amateur applications of any

type please let me know what the results were.
Thanks
Dan

I saw a packet message (which I can post if there is interest) about a
commercial SoftTNC program from the author of PMP (Andy Payne, N8KEI)
which is sold by j*Com.

I would like to know more about it especially from users who have upgraded
to it from PMP. The price of the program was something very reasonable
like $20. One improvement that SoftTNC is supposed to make over PMP is
to expand the keyboard buffer so that you can actually type while traffic
is being decoded.

Also in this packet message was information about modifying
PMP to talk to a "Baycom-style" serial port modem just by changing the
configuration file.

I just wanted to thank everyone for their responses regarding my posting for

KA9Q's TCP/IP source code. The result was that the FTP site ucsd.edu
was the official site for this software. Also, a copy of the source can
also be found at world.std.com (192.74.137.5) in /pub/hamradio/pc (the World
hamradio FTP area is maintained by the Boston Amateur Radio Club).

Again, thank you all for your help.

As a starving college student, I decided that the best way to get on
packet (ie cheapest) was to make the PMP modem that has been around for
about 2 years now. I originally wire-wrapped the board, which is still
working, but would like to make a couple more for the wife and my father.

Is there any interest out there for the PMP boards and subsequent kits??
I am thinking about making up a few for the local club - I've had quite
a few people want the info/parts and will be making a large order rather
soon. Just thought I would throw this out for those interested in a
cheap method of getting on the packet side of things.....

I can be reached at:
monty@iastat.edu -- Internet

N0QVG@N0AN.IA.USA -- Packet

Thanks and 73,
Joel Montgomery

We have used many of these (in the commercial bands) and they are quite
good. The are crystal locked transceiver boards (one of two channels)
that can cover a few megs (i.e. the two xtals need to be around the same
area or you have to re-tune). They will put out 4W peak (there are various
versions) but for continuious operation they must be de-rated.

The companion 9600 data board uses gmsk. You feed it up to 9600 async
and it generates the preamble and synchronous dgmsk for you.
It would be nice if it had sync capabilities (so you could hook some
FEC chips to it).

They are pricy (for amateur use ~$500 I think).

I just got a couple of GMSK modem chips from a company called MX.COM.
It generates the RX and TX clocks from on board PLLs, and so looks like
a nice base for a high speed modem. (up to 19K2)

I have a question??? Th article on SP software by dl1men
 is listed by the author as FREEWARE??
 If it is FREE there should be no requests for contributions.
 I feel this should be listed as SHAREWARE.
 What does the list think???
 Ken

CN>can beep her and we can type messages back and forth using these radio-based
CN>terminals.

CN> Is that right? Is that expensive?

That's right. You have not stated where you are (and I can't tell from the usenet address where you are). You AND your girlfriend will need an amateur radio licence, they are issued in the U.S. by the F.C.C. (Federal Communications Commision), in Canada the D.O.C. (Department Of Communications), outside the U.S. and Canada whatever government office handles amateur radio licences (in Japan for example, it is the Post Office). To get a licence you will need to pass an exam on electronics, and rules/regulations governing radio (in most nations, very straight forward stuff with a few weeks (or in some nations a few days) study). Cost of a licence (beyond what you pay for tutorial books, etc), in the U.S. and Canada figure on about $5 for an examination fee. For the licence itself you need to pay a $23 yearly fee in Canada, it's free in the U.S.. If you want help tracking down ham licence classes, testing sesions, tutorial books, etc., I (and I hope most of the other people in this conference) would be delighted to help, BUT you have to have that licence first.

As for the rest of the costs, I assume that you and your girlfriend have laptop computers (at least I will not look at laptop costs here). Beyond the computers you will need transceivers (from transmitter/receiver). A battery powered walky-talky (ok, some hams cring at term walky-talky, the usual term is HT), new, will start at about $250 (U.S.) and go up from there, depending on features.

The next point is you need to connect the transceiver to the computer. This is NORMALY done via a T.N.C. (Terminal Node Controler). A TNC contains a modem along with a microprocessor to supervise the radio. The joy of a T.N.C. is that you can attach it to almost any computer running almost any sort of terminal program and it will work. Cost, depending on the features/speed of the T.N.C. $120 (U.S.) and up. I have a Kamtronics KPC-3, which while it does not come set for battery operation, the manual does explain how to (easily/quickly) convert the unit to run on a 9V battery (and there is a space inside the case for a 9V battery). Cost for a KPC-3 is near the low end, at about $120 (U.S.).

If you don't get a T.N.C. the other approach is to get something like Baycom or Poor Man's Packet (P.M.P.). Both of these rely on using a simple/cheap modem circuit, and have work that in a T.N.C. would be done by the T.N.C. microprocessor done by the host computer. The problem with the Baycom/P.M.P. approach is that you must run a particular program on a particular computer for things to work. The advantage is, it is cheap, one firm is offering a pre-built Baycom

compatible modem for IBM PCs, cost, about $50 (U.S).

CN> Thanks!!

73s (best wishes) from VE3ZAA (all nations are restricted as to what
                               callsigns they can use, from my
                               callsign it is possible to tell I am
                               Canadian).

It is indeed possible. I used to remote sysop the W8SP PBBS using an HT
into a 1/4 wave groundplane up about 30 feet. Whether it is desirable is
a topic that has spawned many a flamewar. HT's have two things going
against them for packet use:

1. The low power may exacerbate the hidden-terminal phenomenon. You may
find that you do OK when you have the frequency all to yourself, but
can't get through when there's more than one session going on on the
frequency.

2. HT receiver front ends may not be as selective as typical mobile or
desktop rigs, and thus may be more vulnerable to QRM than mobile or
desktop rigs. And, unfortunately, a little QRM may make a packet QSO
impossible.

Nevertheless, it sometimes is possible to successfully use HT's on
packet. A lot depends on how close the nearest full-time switch is and
how busy the packet frequencies are in your area.

Mitch, if you're looking at the multi-modes, I, as the owner of an
MFJ1278, can definitely tell you that you should be considering a PK-232
or a KAM <grin>.

I haven't had any trouble connecting with other stations with the 1278.
My main gripe with it is that the firmware seems to be something of a
kludge. The non-packet modes seem to be sorta tacked on to the side of
the packet engine - especially AMTOR, where it is obvious that the TNC
switches to an entirely different set of firmware(the 'real-time' clock
available for monitor time-stamping is suspended while in AMTOR modem).

Of course, you need some different software for different modes, but my
point is that there seems to be little integration between the various
modes in the MFJ1278. The firmware is a mere hack compared to what
appears to me to be the better-thought-out firmware in the PK-232 or the
KAM.

Why then do I own a 1278? Well, mainly because someone offered a
straight swap on it for a 1270, and I bit. On that basis, it's OK, but
if I were looking to spend good money on a multi-mode TNC, I'd probably

opt for the PK-232.

I have been using Baycom software for about a year with two "Baycom" modems (one bought, one built) and have been extremely pleased with this method of using packet. In fact, when I describe some of the features of my "TNC" to my friends with store-bought TNCs, they are often jealous of what I can do with mine.

Recently I got interested in getting on TCP/IP over amateur packet radio. I got myself an IP address and am all ready to communicate. However, I need some software to do the job and I would guess that the many NOS packages available all want to talk to external TNCs.

Does anyone know of a way to get onto TCP/IP with a "Baycom" style modem?

Tnx es 73,

Erich, you can get KA9Q's TCP/IP for *free*. That's a good price for
what is probably the best all around DOS TCP/IP package available. It's
what nearly everyone is using. There are also versions for OS/2, Unix,
and the Mac and Amiga, though those are a few revs behind the DOS versions.
None of them, except the OS/2 version, know what a mouse is.

As to TNCs, there are two choices, an internal card, or a TNC2 compatible
external TNC. I'd say get a PacComm Tiny 2, or MFJ1270 for the external
TNC alternative. Chuck the firmware ROM that comes with them and install
the K3MC KISS only ROM, hex images of this ROM are available free for
downloading and burning. Or, buy a Gracilis board, or Ottawa PI card as
your internal option. These options are all supported by the KA9Q TCP/IP
packages. Some of the KA9Q varients include a full featured BBS, all
include standard AX25 capability in addition to TCP/IP, and all are
multi-session, multi-tasking. You don't need any other software to do
packet.

Yes. Try ax25drv.zip. It is a packet driver for a Baycom modem. I believe
that it works with the latest DOS releases of the KA9Q package. The file,
with docs and assembly source code, is available for ftp on ucsd.edu. The
file is /hamradio/packet/tcpip/ax25/ax25drv.zip.4-jan-93 (or something
similar). Have fun!

My boss (see P. 47 of the March issue of QST for a wonderfully
hilarious article about FO20) and I are avid FO20 users. And we've
both noticed that connections suffer (mildly) when the bird is higher
(elevation-perspective-wise) and seems to do much better at the beginning
and endings of passes.

Which is fine, because the orbit of FO20 is such that it hangs out
down there for the majority of the pass, and only gets to the
higher elevations on my rotor for tiny portions of the pass.

But to answer your specific question, I find that cranking the
FRACK down to a ridiculously low setting, so that the TNC tries
much more often than it would for terrestrial contacts, works
very well.

And of course, I make the hopefully-valid assumption that you have
your TNC definitely, absolutely, 100% in the FULLDUP ON mode...

try nos -f nos.cfg

you will need to add a file called nos.cfg in which you specify where your
files are. The default is "\".

I run a large domain file in a virtual disk & just have the line
"Dfile = f:\" in my nos.cfg file everything else runs as default.

>
>Is there a comprehensive doc file on this version of nos?(

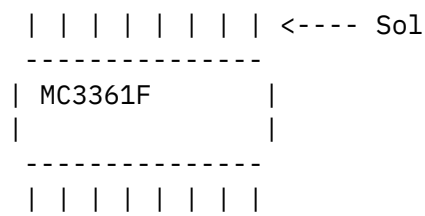
____
If anyone is interested in modifying the Alinco DR-1200 Dataradio for 9600
packet use, here is the info.

I recently purchased this radio, in the hope of modifying it for 9600 packet
use, as the advertisements mention. Being true fm and not phase modulated,
I thought this radio would be a true performer at 9600 baud. What I didn't



know is that there is no info in the manual on how to hook up the G3RUH modem to it.

Luckily I bumped into the May 1992 issue of CQ Amateur Radio, and on page 69, Buck Rogers, K4ABT, describes how to modify the Alinco DR-110T for 9600 baud use. I was almost sure the dataradio was nothing else than a DR-110T with no mike, an LED panel, 25w output and a catchy name. Comparing the insides of the dataradio with the dr-110t mods showed it was the same.

To inject the Tx audio is a bit difficult. The VCO unit is enclosed in a solid metal case, withe the PC board hidden away.When opening the unit, the VCO is located to the left side, just behind the VFO knob. You must unsoldier the VCO unit out of the main board. It is held by its case at 4 points. Under the VCO unit are 10 pin connectors. These must also be unsoldiered. I used a Radio Shack desoldering iron, and was a piece of cake to remove.
Once you remove the VCO unit, look at PIn 7 on the soldier side of it. This pin will go all the way to a surface mounted resistor, and next to it is the varactor diode. Soldier a 1/4 watt 10K resistor to the junction of the resistor and the diode. The diode is surface mount, so be very careful. Then connect the TX audio cable to the other end of the 10k resistor. K4ABT suggest to use a 4uf non-polarized capacitor after the resitor, but I didnt use it and worked ok.

To get RX audio from the discriminator, locate a PC board sticking up next to the lithium battery backup. behind the volume. You can see at the top a 16 pin surface mount chip, labeled MC3361F. Pin 9 of this chip is the discriminator output. It is also tiny, so be careful.

As all 9600 baud work, USE SHIELDED AUDIO COAXIAL CABLES!

I did the mod, and TX and RX are absolutely perfect. For the price of this

radio, it is a great performer.

73's de Ramon (KP4TR)

==========
KA9Q: NOSview RELEASE [304]
==========
by Ian Wade, G3NRW

NOSview [304] is now available via FTP on

        *
        *   ucsd.edu: /hamradio/packet/tcpip/nosview   *
        *

Download the file:
                    * * * * * * * * * *

```
                    *                 *
                    *   nosvw304.zip  *
                    *                 *
                    * * * * * * * * * *
```

NOSview, first introduced in September 1991, is an on-line documentation and runtime package for the KA9Q Network Operating System (NOS). It contains:

++

*** probably the only complete reference work anywhere that describes all of the commands to be found in the major NOS releases.

*** a TSR file viewer that lets you read the NOSview documentation on-line, without breaking out of NOS.

*** NOSgas: the "NOS Get-Away Special" -- a complete set of working NOS runtime software, based on the PA0GRI 2.0m release.

*** a complete set of templates for the NOS control files.

*** full details on how to get the book "NOSintro", which describes in detail how TCP/IP works and how to use KA9Q NOS. Ideal for beginners to TCP/IP (and more advanced users will find many gems of helpful information there as well).

++

NOSview [304] contains many new documentation files, and the template NOS control files match the listings in the book "NOSintro".

Extras include ....

    UUENCODE/UUDECODE file conversion utilities
    AX.25 Baycom Packet Driver
    KISS protocol documentation
    HOSTS <> DOMAIN conversion programs
    PCElm and ELM Mailers
    The Clockwork VIEW TSR file viewer

As NOSVW304.ZIP is quite large (around 700 KB), you may prefer instead to get your copy by mailing a DOS-formatted diskette (any size EXCEPT 360 KB) and return mailer to:

     Ian Wade, G3NRW
     7 Daubeney Close

Harlington
DUNSTABLE
Bedfordshire
LU5 6NF
United Kingdom

Please enclose return postage as follows:

United Kingdom:	UK postage stamps
Rest of Europe:	3 IRCs
The Americas, Africa:	7 IRCs
Rest of the World:	9 IRCs

(Any unused IRCs will of course be returned).

There is no charge for NOSview, so please do NOT enclose
any form of payment.

73 de Ian Wade, G3NRW

February 1993

P.S. If you would like full details of the book
"NOSintro", please email me direct:

Hello net.
I am considering starting using AA4RE on a KAM.
I am running the 5.02 KAM with the TAPR DCD HF and VHF Mod.
I am currently running the HOSTMASTER II+ software.
I am running Desqview 386 on a 386/25 machine.
What do I need to do to get this thing up and running?
What are the little things that I need to do,like turning
on the Desqview switch in the AA4RE package? etc etc etc

Any help and advise would be appreciated.

Thanks

 BR> I have ordered 3 IF filters and the service manual, when they arrive
 BR> we will try and set the frequency and see if there is any improvement,
 BR> if not we will swap out the filter.

 BR> I hope to do this next weekend. I will post the entire escapade
 BR> shortly after that.

        Hi Bob:

                Like you I have come to the conclusion that the problem
        probably lies in the narrow IF filter. I am going to send them
        the $18.00 for the filter this weekend and do the install as
        soon as it arrives. I checked the frequency of the radio with
        no modulation and found it to be within 70 hz. I never even
        thought about checking it with modulation. I suppose that comes

from doing these things at 2 am! I'm still concerned about the low output from the modem. The path I have to work with is a LONG one. It is 35+ miles to the nearest node and the nearest other 9600 baud station is a good 45 miles. I working off a 70 foot tower so that will help a bit. I look forward to seeing the results of your experiments. If I get mine working (after rechecking the freq.) I'll post you a note about it. I have considered using a LF353N op amp with a gain of about 3 to 4 db to boost the output to a higher level for the radio. The LF353 should be fast enough (13v/mmsec slew rate) to handle the bit train without phase shift. I forgot to ask Tad at MFJ about that and my give them a call before trying it.
Keep in touch! 73.

RB> I am running the new wg7j nos. I have created a virtual drive E where
RB> I keep th e nos files, including the autoexec.nos file. When I run the
RB> j7nos file (nos.e xe) it does not seem to be able to find my autoexec
RB> or domain.txt files.
RB> What shoudl the command line be?

RB> Is there a comprehensive doc file on this version of nos?(

Hi Robert:

Which version of WG7J NOS are you using? The most current is version 1.08B which came out on the 24th of this month. If you

are using anything later than 1.06 I believe there is a command line switch to read a configuration file. This is entered thus:

```
  nos.exe -fE:\stuff\nos.cfg     # or whatever you what to call it.
```

The file E:\stuff\nos.cfg could then contain a listing of various path and filenames to the different files to read on start up. This file can then point to RAM drives and the like. All most all of the files and directories can be set from this file including the AUTOEXEC.NOS file and DOMAIN.TXT

You can FTP the latest version from Johan's mini-FTP server here on the net. FTP to wg7j.ece.orst.edu and log in as anonymous. Look in the "108" directory for the latest version and documentation.

I have seen that people have been having problems using the Alinco 1200 radio for 9600 baud packet. I would like to get something up and running someday, and would like to know what other people are using, so that I could buy something that works right!

The cheapest radio that I have found that supports Direct FM is the RAMSEY kit. When an amplifier is added, it is about the same price as an Alinco 1200. The Hamtronics kits look interesting because they use helical resonators in the front end! But they are expensive compared to other radio kits, and are crystal bound to a single channel. I could accept single channel operation, but would prefere to be able to change

between multiple channels to support PACSAT and terestrial operation.

     So: What radio do you use for 9600 baud operation, and what
radio would be the BEST and why? Which ones need the fewest modifications?
Which ones have the best performance?

Thanks
alan

Hi All,

 I am looking for FTP sites for the following files:

 R95 - packet compression to ascii converter
 7 plus - Same as above but different type
 Aplink 7.01 - Amtor packet mailbox
 TKC 1.80 - packet Terminal program for F6FBB bbs..

 thanks in advance..

Here piggy piggy piggy. This is a poor channel sharing strategy.
It maximizes *your* chances at the expense of everyone else. If
everyone does it, it minimizes everyone's chances of using the
satellite.

A kinder gentler packeteer will set his frack so that it's longer
than the longest possible roundtrip acknowledge time. Otherwise
he can clobber others with great regularity. A truly considerate
operator will use P-persistant backoff and spend his time trying
to improve his RF capabilities, both up and down so he'll have
fewer garbage frames.

No not really (YET anyway :-)) ... We do however have access to a gateway
in New Jersey USA via a link provided by NBC TV's ARC.

I see that your in Kingston, you should be able to access the gateway
if you run tcp/ip on your radio have a look for my switch on 144.625
you should be able to get into one of the gateways via me, just try
pinging 44.64.0.99 (wg2w.ampr.org)

Hope this is useful

Regards Simon

I can't even begin to imagine how ARSENE is going to work, given
the trouble I've had getting onto FO-20. Perhaps it will be
armed with something to automatically cut off someone who sends
more than 1 packet every 30 seconds or something like that based on
load.

Baycom and YAPP; something to look for

This morning on our local packet BBS, a message from:

Mr Guy Marchal ON5FM@ON7RC.BEL.EU reported that YAPP now exist to run on

a Baycom. It is made by Mr Frederic Aguilar FD1TKW.

The message said that those 3 files are available:
        B-YAPP.EXE
        B-YMONO.BAT
        B-Y.BAT

The message never said where and when we can get it???

It would be great for all Baycom users if somebody can contact them and put
this software on the Internet if possible. Without yapp, I can't even
transfer a file (..) with my baycom... My site has an anonymous ftp server
and I could put it in there if I can get a copy.

Clem

I'm running jnos108b and have a question about the FTPUSER files.

What I would like to do is set up permissions for a couple of friends
to not only my /public direcotry, but access to a /private directory
on another HD.

I run nos on a subst N:\ drive if that is of any help.

I have tried:

kb4nvo wi3p secret c:\private 127 \public

but get permission denied for both directories?

Anyone help me on this?

Thanks & 73,
Tom Collins

Hi, I need a list of mail order stores that carry PacComm's products
in order to buy a TNC-NB96, a 9600bps modem with TNC.

Why I don't go direct to PacComm ? well sometimes it is cheaper
to buy from a mail order store than the manufacturer.

Thanks

I have recently come across a letter dated 17th Feb 1993
from Mr Martin Redmond, U.K. Member of Parliament, detailing answers
to 15 questions put to him by a constituent. His reply to
question number 15 is ;

"Agreement has been reached that the passing of third party messages
should be made available to licensed amateurs. This facility is
likely to be effective from around the middle of this year when a
licence can be issued under the Telecommunications Act; the necessary
amendments to the Amateur Radio Licence will be made and announced
simultaneously."

thought this might be of interest to UK readers. Please note I do not
claim this is definitively true. I am just posting what I found.

Cheers
JJ

Does anyone know of an FTP site for the CROWD node software that is used by
N.E.D.A. and many other oranizations. This software is for multi-station
conferencing, such as for Packet nets, and the software acts as a stand-alone
node in a tnc by itself or in a diode-matrix....

Any help leading me to an FTP site would be appreciated....

Ok, I've been looking at the message traffic in this conference and I
have a couple of questions. I am interested in becoming knowledgeable
in packet radio technology. Partly because I'm in the military and we
have some HF packet radio applications and partly because Data
Communication is my field and I'm interested in what the HF/VHF ranges
can support in the way of message & data transfer.

I am currently studying for the Technician's License. Is it worth the
extra effort to study Morse Code (5 wpm)? Does it save any money to
test for both at the same time?

What FM radio is recommended? What about the TNC? Is there a special
version of comm software required, or can I use my Procomm Plus? What
about antennas? Are there any special mounting considerations such as
lightning protection? What are all of these items going to run me ($)?
Is there anything else I need to consider?

Lastly, Does anyone know someone in the Oceanside, CA area that
administers the tests...i.e. a local HAM club?

Thanks in advance...
Drew

Has anyone every actually gotten an MFJ-1214PC to work? This is their
multi-mode unit with a "dumb" modem. That is, there is no CPU chip
or digital logic in the unit -- it supposedly just converts audio
tones into a high/low logic level. A software program that runs on
the IBM PC/compatible computer decodes the logic levels and displays
the results on the screen. Modes include packet, AMTOR, RTTY, morse
and FAX.

The trouble seems to be the modem-to-computer interface. I can see
the DCD light on the modem blinking in time with the incoming signal,
but nothing is getting sent to the computer. (I tried both RTTY and
morse modes.) The interface is supposed to be RS-232. The manual
specifies the pins that the RS-232 cable must have connected:
1, 4, 5, 6, 7, 8, 11, 20 and 22.

There are two wierd things about this. One is that neither the
receive or transmit data pins (2 and 3) are included in this list.
The other is that they insist that pin 11 be connected, but pin 11 is
a "no connect" in the RS-232 standard, and for sure my PC serial port
does not use it. By the way, I confirmed with an ohmeter that the
pins listed in the manual are indeed the pins connected to something
inside the modem.

My computer's RS-232 port works fine with my 2400-baud Hayes-compatible
modem and with my Kantronics KPC-2 TNC. The MFJ software is properly
configured for the COM port I am using (COM2).

After LOTS of busy signals, I finally got the MFJ tech line, but the
guy had no answers other than to send it back for repair. One idea I
had was that maybe I accidentally got the Atari or Commodore version
of the unit, but he said the hardware is the same for all three.

Any help?   Thanks!

I would like to send packet mail to a user at RK3KP in Moscow. Can anyone
advise what the full address would be?

Is it....
     <user>@rk3kp.moskva.ru.su.eu
     <user>@rk3kp.ru.cis.eur
     <user>@rk3kp.#moscow.rf.cis.eeur.eur ...?

Is there an ftp site with a file/list of the different packet mail zone/domain
abbreviations available for downloading anywhere?

Please reply via email and I will summarize.

David.

Hello.

I have a couple of items I'd like to move. I have a Kenwood TM-221A
2 meter mobile unit, and a PK232-MBX TNC for sale.

The Kenwood TM-221A is in excellent condition. I am the original
owner, and it comes in the original box with all documentation.
It's been a real good unit, but I'm going for a dual bander.
It has extended receive, from 140 to 174 Mhz, and will transmit
on an frequency in the 2 meter band. I sent it in to the factory
about a year ago for a checkup. The right dial light has burned out,
ut this is a very easy, inexpensive fix. 50 Watt power on high,
low is adjustable. It has several memories, and scans. It has a
very good receiver, with GaAs devices in the front end. Excellent
in-band sensitivity. Paid upwards of $400 for this one.
Asking Price: $250.00

The PK232-MBX is less than a year old, and comes in the original
box with all documentation. The packet bug bit me, but I didn't
get the fever. This unit has seen very little action, in new
condition. Functions nicely as a TNC, a has many other capabilities

such as AMTOR, RTTY, several FAX modes, etc. Will send as well as
receive these modes. Has mailbox capability. I'll even in throw
in the cables I built to connect the unit to the PC. I paid over
$300 for this one just a short time ago, and they haven't gotten
any cheaper..
Asking price: $250.00

If you want more info, or want to make an offer, drop me a note!

Thanks,
Russ Crisp

--------------------

------end includes-----
```

I have this set up (I think) to get all outgoing mail, and put it in the wb7ulh area (the name of the BBS that I forward to). One of the problems is, everytime the BBS that forwards to me connects, it seems to hang. I believe that he connects with NETROM, and I have set him up as a BBS in my FTPUSERS file, although I think that only works with TCP/IP stations. The NETROM nodes that forward to me use version 1.00 of TheNet (blech), the node that he uses to connect to me (not PST, but LGU) always seems to hang on everyone. Do I need to tell him that he needs to use PST to connect, or is there something on my side that is the matter. I have my station set up as the SMTP gateway, I don't know if that is right or not. I have tried to send test messages out, but it seems to scan the rewrite and alias files, doesn't find what it wants, and then sends them to my station again, repeating the whole process.

It seems to be able to forward mail to other TCP/IP stations (of which there is only one!), with no problems, it is going from SMTP to AX.25 that seems to be the problem.

What is wrong with my files, I have the ALIAS in the root directory, and everything else in SPOOL directory?

Thanks much, and 73 de Dan N7NKR

```

I ve just installed tnet-x1h on one node here, when I try to ping the node it
answers with a garbled tcp/ip packet. Also routing over the node does not work,
all tcp/ip packets that it transmits are being garbled. NET/ROM over the node
works just fine.

Anyone have any idea if there is any possibility to cure/examine the problem
from remote, the node is located at some distance...;(I ve tried to reset the
node but it hasn t cured the problem.

That would absolutely be true on terrestrial links, of course.

But it's also equally UNtrue on the FO20 satellite, Gary. In the
whole Hartford area, I'm only likely to interfere with one fellow
-- my boss -- and in that EXTREMELY unlikely event, one of us
simply does the kind, Amateur Radio, thing - and moves to one of
the other uplink channels.

It's also untrue for another reason. FO20 is so wonderfully unknown
(in spite of our best efforts to create fun articles about it in QST!)
that there's hardly anybody on it at any given time.

Therefore, I stand by my assertion that cranking the FRack down
to something otherwise-wierd like TWO is a logical thing to do.

Besides, it works fine. And impacts on nobody.

Good point. Even so, I'm actively enjoying the prospect of setting
up an ARSENE-gate for local HT-and-a-TNC users to thrash away on
ARSENE.   It should be quite a chuckle!

I don't believe for a second that your difficulties with FO 20 are
related in any way to others using it at the same time. On the other
hand, I don't know WHAT the problem is, except to say that it works
well for me.

By the way, has anybody heard of a launch date for ARSENE?

X-Software: HERMES GUS 1.03 Rev. Apr 14 1992

I operate a land line BBS that maintains UUCP and amateur radio software
for the Atari ST family computers. Download and upload are available on
the first connect.

The complete Hermes 1.03 UUCP package is on-line as are a number of packet
desktop programs. BBS programs, terminal programs etc..

I have part of the pe1chl KA9Q TCP/IP program package. I am missing the
BM (Bailey Mailer ?) and pe1chl related BBS files. If anyone has them please
consider sending them to me uuencode or on a direct connect.

The BBS is Ben's Place, 405 536-6988 and it is on-line 9 PM to 7 AM daily.

Yeah. This thing works somewhat like the Baycom units. It doesn't
use the internal UART so that's why the Tx and Rx pins aren't used.
It uses a software UART and samples status lines on the port to bit
bang the signals. If your RS-232 card doesn't support all the status
lines, some don't, then it's not going to work. Before you send it
back, try it with a different machine or different RS232 card.

I have a Yaesu FT-212RH 2 meter rig. In the manual Yaesu states that
the radio can be connect to a computer and controled via their "CAT
interface." The manual show a simple schematic for a cable which
connects the radio to a "FIF-232C." I have followed the schematic
and tried connecting my radio to a 25 pin RS232C connector, but I have
not been able to get it to work. Could someone help me with this?
According to the manual, the radio's frequency can be controled via the
interface and when a carrier is detected (busy light is on) a +5 volt
signal is sent out from one of the pins. I would like to write some
software to turn my radio into a scanner. It could be made to scan up
and down the band, recording frequencies on which it detected signals.
The software is no problem. The only problem is the radio/computer
interface. Any help would be greatly appreciated.

You can't use different drives, although I believe I read in a digest
bull that someone has mod'd a version of gri2.0m successfully. Maybe
JNOS will have this feature soon :-)

Sorry , I am new to this group. I am finding the following files:
    1. FBB ---for Packet (radio bbs)
    2. something help to download from the satelite for climate Information
    3.Advise on using pc-com this kind of tnc
    4. Good morse code files for learning and using
    5.And files about : tncfax ,tnc24...etc

   Any information is appreciated.
   Thanks in advance!!!

          Jason Chang de Taiwan

Greetings,

A friend of mine has an AEA PKT-1 tnc that he would like to use. He asked me to look it over and tell him what I thought. At this point I would like to ask a few questions before getting back to him.

The PKT-1 appears to be a tapr-1 clone or something quite similar. It does ok displaying ascii text in an ax25 packet but goes nuts (displays trash) when it receives anything else.

Is there any firmware available that will allow this tnc to run in kiss mode?

Is anyone out there using one of these boxes today? If yes, for what?

>the other uplink channels.

Actually your signal is competing with everyone else in the satellite's
footprint, not just the local area. That's a circle at least a couple
hundred km in diameter. Just because you can't hear them doesn't mean
the satellite couldn't have if not for your repeated transmissions.
The satellite is a classic exposed terminal. It hears many competing
stations from outside your local receiving range. The only way you
know they are there is when the satellite fails to respond to your
packets on a regular basis. You can all set piggy parameters and
make all your lives miserable, you can play power wars and make
some of your lives miserable, or you can set up as good as possible
RF transceive conditions and friendly parameters and all enjoy the
satellite.

>It's also untrue for another reason. FO20 is so wonderfully unknown
>(in spite of our best efforts to create fun articles about it in QST!)
>that there's hardly anybody on it at any given time.

Now that's a better reason. If you have nearly exclusive channel
availability to the satellite, you can use piggy parameters to
compensate for a bad RF path without harming anyone else's access
to the bird. Still, having a better RF path will increase your
thruput, so it's worth worrying about in any case.

Don't take this as a personal flame. I just want to make people
aware of the potential interference problems you run into with
an exposed terminal like a satellite. If everyone uses piggy
parameters, not many people can effectively use the satellite.
If everyone makes nice, the satellite will be usable by more
people.

We once had a terrestrial exposed terminal here in North Georgia.
It was a mountaintop site on 145.01 MHz. There were times when
it was held off from digipeating for as long as 15 minutes because
of the excessive number of stations trying desparately to use
it with short holdoff and fixed persistance. Very few of the
users could hear each other direct so they were always complaining
that the digi was broken. Well it wasn't. The site owner brought
in an audio trace log and let it play during a packet meeting. It
almost never stopped squalling during the two hour meeting. That
certainly opened a few eyes. Using longer Dwait values, and ultimately
using p-persistent exponential backoff at most user stations made
the channel usable again until growth ultimately overwhelmed it
totally. Finally, smaller coverage, backbone linked, sites have

solved the problem for now.

Unfortunately it's not that smart Thomas. That doesn't really solve
the piggy problem anyway since stations will continue to send their
repetitive packets effectively jamming the channel for others. It's
what the satellite's receiver hears, not what it's digits decode
that determines the usability of the channel.

Some AMSAT thinkers have suggested using master stations and polling
in a quasi-token ring configuration in order to manage users on

ARSENE. That has a chance of working if everyone cooperates. But it
only takes one or two loud piggies to spoil it for everyone.

I think the biggest problem with any
kind of a token ring situation is that stations will be added/dropped
from the satellite footprint all this time, and if we too wait long for
a station to pick up it's token, and that station is no longer in range,
things will slow down rapidly. Still, if the max wait time is small
(say 1-2 seconds) this shouldn't be too bad. Could you mention some
details about how this might work?

Another approach I thought up was having the digipeater sat send out
packets which said how many users were on, and that you would have a
smart terminal program which would grab these and set the TNC
parameters to apropriate values. If we wanted to be a little elitist
about it, the terminal program would tack on a special token to each
uplinked packet which indicated that the special terminal program
was in use, or maybe not only that but that it also recognized properly
how many users were on, and that packets without those tokens would be
dropped, hopefully keeping users without the adaptive terminal program
from accessing the sat. Of course, this would be annoying. Then again,
it would also be annoying to have a sat digipeater which is uselessly
jammed by a million users who keep sending packet after packet without
waiting. Anyway, since ARSENE isn't smart enough, we'll save this
method for later sat digis.

Think how much better that would have worked if it had been a "full
duplex" packet repeater!

Digipeaters have to go away.

I've run FDX packet over the satellite; it's great!

Hi all:

 I wrote a message a few days ago requesting a FTP site for a Term program called TPK 1.81 for the Fe6fbb bbs software.. I wanted to thank all who answered but all the answers only show the Text or doc files for the actual program.. I am looking for the whole package.. Both the docs and the EXE files..

 The only reason I have to ask this way is because I dont have access to internet myself.. I am using a gateway.. Once I have the FtP Adress I am my sysop here to download the programs for me..

 Thanks for your help and understanding in advance..

HI all,

 I am trying to find out what was the last fireware release for the
Pk-87... I am not sure if the unit is a Tnc1 or TNC2.. I beleive it is a
TNC1.. The reason for me asking is because I am running one with a bbs and
everytime a bbs or user tries to connect, I get a connect request message
on the screen.. For some reason, the version of firmware I have now does
not have the BBSmsg function in the code..I am hope to burn a new eprom
with this function in it..

Thanks in advance for the help

 Si> bull that someone has mod'd a version of gri2.0m successfully. Maybe
 Si> JNOS will have this feature soon :-)

        Sure you can! Just use the DOS SUBST.EXE command backwards.
        ie. "subst c:\private e:\hamstuff\downloads\private" and an
        FTPUSERS entry of "N8EMR buBBles 127 /private" would give access
        to the E:\HAMSTUFF\DOWNLOADS\PRIVATE sub-directory. Round-about
        way of doing it, but it does work.

That's what I figured. But why do they insist on connecting pin 11?
There may be a serial port somewhere that uses pin 11 for something,
but I have never seen one, and it certainly isn't part of the RS-232
standard. Maybe they don't actually use it, but it IS connected to
circuitry inside the box. Something doesn't figure here.

SU>Title   : Alinco DR-1200T 9600 mods
SU>Keywords : alinco dr-1200t dataradio

SU>I recently purchased this radio, in the hope of modifying it for 9600 packet
SU>use, as the advertisements mention. Being true fm and not phase modulated,
SU>I thought this radio would be a true performer at 9600 baud. What I didn't
SU>know is that there is no info in the manual on how to hook up the G3RUH mode
SU>to it.

SU>. For the price of this radio, it is a great performer.

SU>73's de Ramon (KP4TR)

Do you know how much the DR-1200 Dataradio sells for? And if the radio
shack down the street sells the parts for modifying it?

Are there other dataradios on the market today that I might compare to?
SU>|Bensalem, PA |Radio:wb3ftp@wb3ftp.ampr.org[44.80.8.44]|

Bensalem? Is that in eastern or western Penna? I'm originally from
Hazleton, Pa. myself.

Thanks,
Drew

Hello.

I have a PK232-MBX TNC for sale.

The PK232-MBX is less than a year old, and comes in the original
box with all documentation. The packet bug bit me, but I didn't
get the fever. This unit has seen very little action, in new
condition. Functions nicely as a TNC, a has many other capabilities
such as AMTOR, RTTY, several FAX modes, etc. Will send as well as
receive these modes. Has mailbox capability. I'll even in throw
in the cables I built to connect the unit to the PC. I paid over
$300 for this one just a short time ago, and they haven't gotten
any cheaper..

Price: $250.00

If you want more info, or want to make an offer, drop me a note!

Thanks,
Russ Crisp

Hello everyone,

I am a beginner in the field of packet radio. All I have is some
theorical knowledge. Theorically, i know what a packet station is
and somewhat how transmission over the air takes place. I also know
about NOS and how to setup it up to communicate over ethernet.
Now, i am willing to investigate in details the packet radio world.
However, i can't decide what kind of equipments to purchase. i also don't
know where to get them from. In my area there is neither manufacturers
nor vendors of such equipments. Furthermore, there is no assistance
in this area.
What i intend to do is:
     - get two packet radio stations(all equipments)
      whith capabilities of communication: AX25 and TCP/IP
      and eventually others
     - Frequencies 144 MHz+
     - Rate 1200 and eventually 9600

Can someone indicate me what kind of equipments should i get and where
to get them from?
Any help will be greatly appreciated

Khaled

Stay away from the RAMSEY kits. They have a little bit of trouble
keeping the TXO out of the Receiver. We looked at them very seriously
for the Edmonton NOSA group. A few of us with more money than brains
bought the Kantronics D4-10. This radio is quite good. I live under
the umbrella of several pager transmitters and the D4-10 does not
see them leaking in. I cannot say that for any other radio that I
own. We are experimenting with older Harris M2000 trunk mount radios
(these radios were surplus and cost ~$30.00 each). If I was to do it
again I would buy Kantronics. BTW the VHF Kantronics radio does not
stand up as good as the UHF. The VHF version is a little deaf. You

-?- How NEWS -> packet-radio (TCP/IP) -?-
Hello!

(BWT: This's my 1st MSG to internet)

How can I transfer NEWS from internet to packet-radio..?

I have:
- PC with modem and I can read NEWS in UNIX system (not familar with
it) with for ex. RTIN..

- I have run few years FBB AX.25 BBS software at home and I'm now
beginning with TCP/IP, NOS(PJ)..PA0GRI version..

I can copy NEWS from RTIN to a file and then compress it and dowload
but what next...?

How can I then go on..? Is there some PRGs for NOS-systems or...

I have a really nice condition Icom R70 HF receiver I would like to sell.
I have the original box, manual and even the service manual. The radio
works very well, and has never given me any trouble and is like new in
appearance.

It will do as well or better than the ever popular R71A, its follow on.

Priced for quick sale at $385

I'm using NET/Mac v2.3.6 and a PacketMac modem for AX.25 packet (TCP/IP packet hasn't yet caught on here) and have been experiencing regular crashes on my machine with no clearly determinable reason. I have a Mac Classic II with 10 MB RAM running system 7.01, and the only inits I'm using (aside from those belonging to the OS) are SoftKiss v1.2.5 and Symantic AntiVirus Intercept. I've tried disabling the Symantic init, but the problem still exists, so that's not the cause. NET/Mac is the only sofware that I have problems with on this machine and it otherwise never crashes (which is saying alot for a Macintosh ;-) so I figure the problem has to be with NET/Mac in some way.

Basically, the cursor suddenly dissapears and the system locks up, such that it's not even possible to drop into the MacBug debugging window, but a full reset is needed. I've tried all sorts of tests to see if I can consistently crash the machine by some particular function or action, but it seems entirely random. On some occasions, I've used the system for several hours before it locked up, and other times it locks up only seconds after starting NET/Mac. I've tried running with no trace window on, and no other windows but the active session (and console), but nothing seems to make any difference.

In all other respects, the modem and software work very well, but it's rather annoying when the machine freezes in the middle of a QSO or while uploading a bulletin, etc. If anyone has any suggestions, I'd very much appreciate any help they can offer.

Much thanks,

I would assume you have an Amateur Radio License so that you could actually
use the 144 MHz band...

just wondering...

I have an old Grie...I mean Heath HD-4040 TNC-1 clone, that I have installed the TAPR TNC-2 upgrade, which allows it to run KISS mode just fine. I have had it on 24hrs a day for the past 3 months, and not so much as a burp out of it. The kit was really easy to install, it came with fairly good instructions. Contact TAPR for the kit (if they still have it, this was a long time ago).

The TNC-1 should display trash from anything other than an AX25 packet, it has no capability to displayt NET/ROM, TCP/IP, or any of the other neato things..

Hope this helps..

Sorry I haven't worked on softkiss much lately. I am trying to get
caught up on back mail...

I personaly have never seen this lockup problem on a SE/30.
There are two reports that it doesn't lockup if you remove the "tuneup"
extension.
I reread all the sources with an eye to where there would be problems on
slower CPUs. There are two potential problems that I know about:

a)Between accesses of the SCC there must be a delay of 2.2us. The hardware
manual says that CPUs after mac+ insert a delay in hardware as needed.
In the sources I have a delay macro between scc accesses but it doesn't
currently do anything because I didn't see any problems. If this is the
problem it must be real close to not needing a delay since it generaly
works. I can build a version with this delay set to one nop.

b) If you are in the middle of transmiting a packet and interupts are
off for long enough the SCC will underflow. This should cause the
transmision of an ABORT bit pattern so the reciever knows to chuck the
packet and the mac should resend the packet. Softkiss does not
currently set this abort during xmit mode.
I am conducting experiments now to see what would happen if it missed a

transmit interupt. I think the packet would be truncated and the
reciever would think that it was ok (the scc would send out the crc ok).
 What would happen to the mac?   Not sure. I am working on fixing it to
send an abort and count how often it happens. Likewise if the 3
character recieve fifo overflows it should record that in a counter.

Do you come back and find the mac hung or does only ever hang when you
doing something? Does hang only when using keyboard/mouse/floppy/hard
disk, etc.

I have a nice powerful(!) A500 (ancient v1.2 kickstart) sitting at home and
was wondering if there was a hardware/software solution for getting packet
radio. ie I don't want to fork out loads for a TNC when my trusty C=
would be powerful enough to do this with nothing more than a TONE<>RS-232
convertor plugged in.

I think I am basically asking for something similar to the BayComm stuff
for the PC (but I might be completely wrong!!! :-})

For *packet only*, I would recomend a true clone of the TAPR 2.
The MFJ1270B is the default. The PacComm Tiny 2 is an improved
version that is also an excellent choice. The reason for this
adherence to the TAPR standard is that it allows easy upgrade
of modems through the disconnect header, and easy ROM firmware
upgrades. Neither the Kantronics or AEA units have third party
firmware availability, and installing third party modems is
a non-trivial modification. It's also nice that the TAPR clones
tend to be the cheapest full hardware TNCs as well.

Gary

Thomas N3HAU said:

I think the biggest problem with any
kind of a token ring situation is that stations will be added/dropped
from the satellite footprint all this time, and if we too wait long for
a station to pick up it's token, and that station is no longer in range,
things will slow down rapidly. Still, if the max wait time is small
(say 1-2 seconds) this shouldn't be too bad. Could you mention some
details about how this might work?

I say:

Most people don't realise (I didn't!) that ARSENE is not an LEO sat. It
has a high 16/17 hour orbit (its up in a circular orbit at 20, 000
miles or so with a low inclination (?)). This means a lot of different
approches to channel management will work that wouldn't work otherwise
with LEOs.

This was mentioned in Joe Kasser's article below (cryptically but its
there!). The reference to Doppler shift is what counts. I did have the
more detailed orbit info (from a radio-info post?) but I didn't save it.

| The digital transponder is a digipeater. There is no PBBS
|aboard. All users will have to contact stations (in real-time)
|directly via the orbiting digipeater to send them messages.
|Packet radio Bulletin Board System (PBBS) stations will have to

|contact other PBBS stations for message forwarding, individuals
|will contact each other, and they will all be digipeating through
|the same ARSENE spacecraft. Working through ARSENE will be
|similar to working through AMSAT-OSCAR (AO) 13, namely minimal
|Doppler, but some time delay on the signal. Received signal
|strengths however, are expected to be much stronger than those of
|AO-13.

The technology involved is old -- but the orbit will give it some new twists.

Maybe it was on voice. I know a local guy that talked to them on voice
recently.

I was given a (used)GLB TNC-2A for Christmas and Just got it on the air.
At first it locked up if you breathed on it but I found a loose jumper
and soldered it and now it's stable. The manual I got was for an MFJ
(photocopied I think) but it seems to have the same commands.
Apparently it doesn't have a Mailbox, can I upgrade the firmware to a
level that does?
The following it what it says on powerup; can I get something from TAPR?

Tucson Amateur Packet Radio TNC 2
AX.25 Level 2 Version 2.0
Release 1.1.3 03/30/86 - 16K RAM
Checksum $3E
cmd:

Yes there is. Look in the /hamradio/packet/tcpip/tnc1 directory on
ucsd.edu. There is code there.

We're using a TNC-1 at 4800 baud quite nicely locally. :-)

Carl.

Hello.

I have a PK232-MBX TNC for sale.

The PK232-MBX is less than a year old, and comes in the original
box with all documentation. The packet bug bit me, but I didn't
get the fever. This unit has seen very little action, in new
condition. Functions nicely as a TNC, a has many other capabilities
such as AMTOR, RTTY, several FAX modes, etc. Will send as well as
receive these modes. Has mailbox capability. I'll even in throw
in the cables I built to connect the unit to the PC. I paid over
$300 for this one just a short time ago, and they haven't gotten
any cheaper..

Price: $250.00

If you want more info, or want to make an offer, drop me a note!

Thanks,
Russ Crisp

Try a General Electric MVP. We have plenty of em on a network and they
work great, not to mention that they take PLENTY of lightning hits and
are still going. One strike took out both tnc's and comport, but radio
is like a timex.
BTW: Cheap as heck and easy to mod!

Ok, just got my 9600b K9NG modem working with my 1270b. I have only one problem. It seems to be operating in fullduplex mode. I am running the newest version of wg7j's JNOS, and have checked all of the params that are in autoexec.nos. I have also for the sake of arguments, made sure that fulldup is off in the terminal mode as well.

This is the deal, during an ftp, the sending station will send its 1024 "packet" and i am to "ack" twice. Whats happening is im receiving the entire packet, but 3/4's of the way through it, before its finished sending it, i will ack it, causeing it to miss the first of the two acks, and the sender will retry on the first, and i will ack it then. DCD is showing a slight flicker, from lack of full sig on transmitting station, but it cant be this (or could it be??) because the on/off period is not long enough for slot and persist the even thing about generating an ack. This flicker is only slight. In actuallity, i think its probably doing the same thing on super-strong stations, so it must not be this. Note, on ax25 connects, it will NOT collide, but maybe because of the limit of the 256 paclen.

So basically this, im getting collisions and i dont know why. Any answers?

HELP ME!!! PLEASE!!!

Yes. This unit is a licensed copy of the original TNC2. TAPR firmware
will work. The most recent releases of the TAPR firmware require a
RAM upgrade to 32 kb. Your unit should have a jumper to allow this.
TAPR was selling the extra RAM chip too, but I don't know if they
still have them in stock. If not, Digikey or Microprocessors Unlimited
will have the chips in stock.

The MVP is a wonderful radio. It makes a fine repeater at a high RF
site as well. For 9600 baud packet, you can't feed the tones into
the microphone input. The audio shaping filters wreck it. You can
feed the tones into the Channel Guard input, however, and it works
just fine. The only caution is that the CG input is not gain limited
and you have to be careful not to over deviate the transmitter.
The CG input also has no pre-emphasis so you can run into tone twist
problems with some amateur radios unless they are taking the audio
output directly from the discriminator. This is a good practice for
9600 baud in any event however. You can pick up CG in and out at
P9 on the audio board.

There exists a SunOS driver which does the Ethernet-to-KISS conversion.
Get /hamradio/packet/tcpip/sun/ax25ip.shar from ucsd.edu.

>BTW: Cheap as heck and easy to mod!

The GE Custom MVPs are very good radios. I have a GaAsFET preamp on the one I use at home; it ends at least as hot as a Japanese radio but extremely resistant to intermod. If the radio was located in a radio site with other transmitters, I'd probably remove the pre-amp.

However, since the MVP exciter is phase modulated, how do you run the radio at 9600 baud? The temperature control line to the transmit rock doesn't appear to pull the frequency far enough or linearly enough to use as a modulation point. I guess it might be possible to change the varactor/capacitor combination on the channel element, but I'm curious as to what you've done. My MVP is used for 1200 baud packet.

As for another "good" 9600 baud radio, the Motorola Maxar-80 or Flexar radios are direct FM, compact, and use only crystals, not channel elements. They are almost plug/play for 9600 baud; you can even use some pins on the big Molex connector to connect the 9600 baud modem up.

Also, I've heard success stories with the UHF Micors, which are also direct FM modulated.

I believe the 500 might work with an C-64 emulator
which would make it possible for you to use Baycom or
Digicom/64 software. If you use Digicom/64 software,
try to use Version 3.51A as it seems to be bug free.
I have no experience with Baycom so I can not comment
on it.

Does anyone have the proper way to wire an Alinco DJ(or whatever)-160
2 meter handi to a Kantronic KPC-3?

I successfully wired the Radio Shack HTX-202. It seems to be

Yaesu-like; I used the diagram and the capacitor/resistor values given
for a Yaesu HT in the KPC-3 manual. I'd like to hook up my Alinco,
but the mike plug on my Alinco speaker-mike is a 3-conductor sub-mini
while the Yaesu and the HTX-202 use a two conductor plug. The KCP-3
book gives no hints about Alincos or about any three-wire mike cables.

Does anyone have any information on this?

     Thanks

          73 / JBL N1MNF/AA

Keywords: 386BSD, TCP/IP

Adding AX.25 to 386BSD as a native protocol with the ability to encapsulate
TCP/IP takes modifications to about half a dozen utilities, about 30 new
module files in the kernel, and extensive reconstruction of lots of the
various protocol structures in the kernel.

A large part of the problem is that although Berkeley made the code
quite modular and table/parameter driven, they made some assumptions
(such as the existence of datagram and connected modes as separate
protocols, and that addresses would fit into 32 bits) that simply don't
work with AX.25.

A good part of the blame for that goes on the shoulders of the designers (?)
of AX.25, but there is some shortsightedness in the BSD kernel as well.
For example, the ARP table just can't cope as it's currently constructed.

Additionally, the problems of multiport transport-level routing isn't
yet solved in ANY implementation of AX.25, so the 386BSD port doesn't do
that either.

That's about the point where I got distracted and stopped working on the
project. There's a lot to still be done.

However, don't let that stop you from trying. More power to you!

This assumption, at least, will have to go by the wayside as well; it's
becoming increasingly clear that 32-bit addresses on the Internet will have to
be extended in some fashion.

As posted above - I have a DJ-F1T trying to hook it up for
packet. But can't seem to get the mike connector right. Could
some one post how the F1-T's PTT and mike input work - meaning
is it a two or three conductor plug and which conductor is the PTT.
Any help would at least eliminate some possibilities.

i have a mfj-1270b. the only problems i have with it are two. the first prob-
lem is quality of manufacture. i prefer units that have well fitting faces and
screws that seat well. my unit is a little lacking in this. nor is the unit
flush with the table top. i fully admit these are cosmetic differences and are
shortcomings to me. but, i still tend to look at such sloppiness as a sign of
potential inferior components internal to the device. the second problem is
that the unit is very noisy. this may just be my device or a particular lot. a
friend and i bought ours at the same time and both units are noisy to my radio.
the radio is a knwd th-27a. this could be a problem with the radio but you have
to check out the radio you plan to use. the noise level was sufficient to force
me to install an outside antenna in order to reach a local bbs board.
however, i have had no problem with the unit from a functional standpoint. i
guess the bottom line is would i buy the unit again? probably not. this is due
to what i have seen of their products in other areas. please note that all the
mfj stuff i have (versa tuner II, keyer, tnc) all work. i just am not pleased
with the quality of manufacturing. THIS IS A PERSONAL PREFERENCE and you have

to make up your own mind about this. find someone with what you are looking to purchase and ask them to let you look inside the device. pass judgement from there. i have a friend who has a kantronics (i think, i just know it is not an mfj device) and she likes it a great deal. she is able to operate her handheld from the tnc with no noise problems.
i'll quit now. look around some more and see what fits your budget best and offers the most bang for the buck.

Actually I've found the MFJ1270 to be the *quietest* of the TNC2
clones. *But* there are a couple of things you have to do. First
that tin box is a better shield than the diecast boxes used by
PacComm and TAPR itself, *if* you scrape the paint off the joining
surfaces and tighten the screws carefully. It's certainly better than

plastic cased TNCs. Secondly you must, as with other TNCs, use shielded radio and computer cabling.

With those two steps executed, the only remaining problem may be a harmonic of the microprocessor crystal falling on a 2 meter packet frequency like 145.01 MHz. If that's the case, and about half of them do, then a small "gimmick" capacitor across the crystal will move the harmonic out of the way.

Operating with a rubber dummy load equipped HT is usually a problem anyway. The close coupling of the radio cable and the antenna almost always results in RF feedback to the TNC. A divorced antenna is by far the best solution to this problem.

Gary

>P9 on the audio board.

I agree with Gary that the MVP is an excellent radio. There's plenty of room in the front end casting to mount a GaAsFET pre-amp in series with the receiver lead; I used the little Hamtronics board. It makes the receiver quite hot and still relatively crunch-proof. On a mountain top, though, you probably wouldn't want to use a pre-amp.

However, the VHF MVP is not as well suited to 9600 baud operation as Gary would suggest. The MVP exciter is a phase modulated design. There is no method normally provided to frequency modulate the radio; the temperature compensation line to the channel element does not pull the frequency far enough or linearly enough for 9600 baud packet.

Gary is correct that the Channel Guard (CTCSS) signal is not processed as the microphone audio is. However, the CG input phase modulates the radio just the same as the microphone audio does. Furthermore, the microphone audio is *not* pre-emphasized when it is fed to the phase modulator. The microphone audio *is* pre-emphasized before it is fed to the clipper, then it is de-emphasized and then low-pass filtered. Though I haven't done the Spice model of the networks, it would appear that the mic audio is relatively unchanged with respect to frequency response.

As far as I can tell, the CG signal is handled separately to avoid a couple of things; first of all, since the CG input is of known amplitude, there is no risk of accidental over-deviation and the mic audio circuit may introduce unnecessary distortion. More importantly, though, the phase modulator inherently pre-emphasizes the audio fed to it (that's why the microphone audio is not pre-emphasized when it gets to the phase modulator). The low frequency CG tone results in much less effect deviation than the mic audio several octaves higher, so it may be of a high enough level to clip in the mic stage. This would severely distort the mic audio.

I would think that feeding the 9600 baud signal directly to the phase modulator would result in a pre-emphasized signal with effectively no low frequency response. Using the CG input avoids the distortion the mic audio would likely introduce, but it still results in a PM signal.

Now, I haven't looked at the UHF MVP; maybe it does FM the rock for CG, but the VHF certainly doesn't. That's why my MVP is a 1200 baud radio. It may be that a 9600 modem "works" acceptably with a PM radio under some circumstances, but I don't think it is optimum.

I have written most of the firmware to allow a 68hc11 to act as a tnc, but
I can not find anything on net rom or thenet. These are not necessary but
having pages of control characters and beeps are not fun when the software
is in passall mode. Thanks in advance.

I just layed my hands on BAYCOM V1.5, but the documentation doesn't have
anything on a modem. There is the parts list, but there is no schematic. Does
anyone out there by chance have an ASCII format schematic, or know where I can
get one, or know where I can get an already-built one?

Hello, all

  I just read 30 posts and the FAQ, and I still don't quite get it. May I ask you to disillusion me (or get me started)?

  Here's what I think packet radio can do: I can get a laptop outfitted with a TNC and a radio and give my girlfriend one too, and then when she's in class, I can beep her and we can type messages back and forth using these radio-based terminals.

  Is that right? Is that expensive?

  Thanks!!

Chris

I am looking for the source for any version of Ka9Q NET/NOS that has a Gopher server. The only one that I am aware of is net091b.exe, but I have been unable to get in touch with the author.

If he is reading this, or if anyone else can help me, I would greatly

appreciate it.

Thanks,
Ashok

>The MFJ1270B is the default.

I had always heard that the MFJ1270B is a true TNC2 clone. Well
it is and it isn't. The PC board has been modified to add a few new
features (like an HF tuning indicator.) And the software has been
extensively modified to add new features (like a bulletin board).
A friend noted some compatibility problems when he tried to use
a 1270 with one of the popular DX contest programs. And I have
found out that, apparently, the XON/XOFF serial interface protocol
got broken somewhere in the software modification process.

Does anybody make a TRUE unvarnished TAPR TNC2 clone?

I recently bought an MFJ-120B TNC and am having trouble interfacing
it to my terminal. Specifically the XON/XOFF protocol doesn't work.

Background: TNC2 clones have 2 ways of handshaking between the
computer/terrminal and the TNC. Hardware handshaking uses the RTS/CTS
lines on the RS-232 interface to slow down transmitted data so as not
to overflow the receiving device's input buffer. XON/XOFF handshaking
works with a 3-wire interface (no RTS/CTS wires). The receiving device
sends an XOFF character (control-S) to stop the sender when the receive
buffer is almost full. An XON character (control-Q) is then sent later
to re-start data transmission.

The MFJ-1270B does not respond to XOFF characters. This is true both
for XOFF's sent automatically by my terminal and for control-S's sent
manually from the keyboard. I have the XFLOW parameter set to ON,
and START and STOP are set to the proper XON/XOFF characters. I tried
all possible PARITY and 8BITCONV settings. The problem appears at
(at least) 4800, 2400 and 1200 baud.

My old Kantronics KPC-2 TNC works fine, by the way. It responds to
XOFF and XON characters whether sent automatically from the terminal
or manually from the keyboard. I compared KPC-2 and 1270B parameter
settings for all parameters that sounded like they could possibly have
anything to do with the problem, to be sure they are set the same.

Has anybody else had this problem? Any clues?

Well the MFJ1270B doesn't have the HF tuning indicator, that's the
MFJ1274. It does have provision to be driven with TTL levels as
well as RS232 levels in order to ease use of Commodore C64 machines,
but that's an unimportant change.

As far as the firmware is concerned, you can replace it with a TAPR
ROM if you like, but most serious packet users chunk it entirely
and replace it with a K3MC KISS only ROM or a GRAPES KISS56 ROM.
Then NOS will never be surprised by a cmd: prompt.

Gary

Chris-

You seem to understand part of the technical side of Packet Radio. The scenario with you and your friend typing messages, is certainly possible. However, that's not all there is to it.

First, most of the people who participate here are Ham Radio Operators, licensed by the FCC. You didn't mention whether you and/or your friend were licensed or not. Both of you would need a Ham license to use the system.

Since many Hams have both a radio transceiver and a computer, the only additional expense would be for a TNC. The cost could range from around $50 for one of the Baycom or "Poor-Man's-Packet" setups, to around $1000 for the most sophisticated TNC. A typical 1200 baud TNC to use with your Two Meter Ham Transceiver, might run around $150.

Although the 1200 baud TNC sends "packets" at that rate, the actual data transmission rate can be much slower. Many users occupy the same radio frequency, each taking their turn to send one packet at a time. Sometimes the packets collide, and have to be re-sent. Time delays can be so great that file transfer programs like X-Modem, time-out before any significant amount of data can be transfered.

There is probably a Ham Radio Club at your school. I suggest you make contact with club members to find out more about Packet, as well as Ham Radio in general.

I was wondering if anyone in this group was running a dual-screen
packet installation under Desqview?

My current installation allows me to run Packet on the monochrome
display while running DOS applications of the VGA display while in
Desqview. I seem to be having some problems, and would like to
confer with others that have already found solutions for this
type of an environment.

Thanks,

Glenn

Sure, TAPR does. They'll sell you the circuit board and schematics and a floppy with the manual and software on it for $30. Tell them you're going to use it for 9600 bps only and they'll throw in a copy of my notes on what parts you can leave out if you don't need the internal modem.

just looking at an ad in RF Design for these RF Modems. frequency range
specified from 403-430 and 450-470 MHz, 2 or 4 W, 9600 BPS.

seems like there should be (no, must be) a way to use these in amateur radio,
if the price is right. (probably some prohibition about the modulation
schemes [msk, dgmsk] in use with amateur radio, no doubt).

anybody know anything more about these boards?

Does anyone know of a software package that can analyze packets received
using a TNC in KISS mode?

We have a local packet-type signal that I would like to identify. It
appears to be 1200 baud, BEL-202 (1200/2200), but possibly non-NRZI. I
was hoping to locate something that could at least determine the call sign
of the packet station, not necessarily the information in the packet.

(I tried asking this last week, but our mailer seems to have died
temporarily...)

If I were to be set up for operating packet on 2m, and someone I
wanted to communicate with was also set up for it...

How do I get my message(s) from here to there? Do I have to
determine a repeater path from here to there, or do I just send it
into the ether (and hope)?

A complete description of the process would be nice. A pointer to
an ARRL (or other) publication would be OK. email is fine.

thanks

     seh

i realize this really the isn't the right place for this but all you packet
users seem to be fairly much computer oriented
i just received a boat anchor computer called a CADO Systems mod CAT III
does anyone out there have any idea what i can do to this machine
to make it work as a terminal system ?

tnx in advance

"NOSintro", the definitive guide to the KA9Q Network Operating
System (NOS), is now available.

In "NOSintro" you'll find a wealth of practical information,
hints and tips for setting up and using the KA9Q NOS.

Ideal for beginners and more advanced users alike.

The emphasis is on hands-on practicalities. You'll see exactly:

**   how to install NOS on a PC.

** how to set up the control files.

** how to check out basic operations before going live.

** how to use NOS commands for transferring files, logging in
    to remote systems, sending mail and so on.

MAIL ORDER PRICES
==========

All prices are in (GB pounds sterling).

Mail to UK addresses:	12.85	GB pounds
Airmail to rest of Europe:	14.42	GB pounds
Airmail to Americas, Africa:	16.73	GB pounds
Airmail to rest of the world:	17.34	GB pounds

Payment either:

1. By cheque, in GB pounds sterling, DRAWN ON A UK BANK ONLY.
    Cheque to be made payable to "DOWERMAIN LTD" and crossed
    "A/C PAYEE ONLY". No other banks or currencies please; it's
    too expensive to convert to sterling.

    or

2. By credit card. You will be charged the appropriate price
    listed above in GB pounds sterling. Your credit card company
    will add a nominal currency conversion charge if applicable.

To obtain your copy, please print out and fill in the order form
below:

--------------------------- cut here ----------------------------

NOSINTRO ORDER FORM

Name: .....

Address: .....

.....

.....

.....

Please send me a copy of "NOSintro" and bill my credit card:

12.85 / 14.42 / 16.73 / 17.34 GB pounds
(delete where not applicable)

Credit Card No (VISA/Mastercard/Eurocard): .....

Expiry Date: .....

Signature: .....

--------------------------- cut here ----------------------------

then mail to:

DOWERMAIN LTD
7 Daubeney Close
Harlington
DUNSTABLE
Bedfordshire
LU5 6NF
United Kingdom

(Please note: your order must be in written/printed form.
We cannot accept orders by phone or electronic mail).

P.S. The book "NOSintro" makes several references to the
      "NOSview" software package. This package contains a
      full working set of KA9Q NOS software, complete with
      all the control files listed in the book.

      The "NOSview" software is available free of charge.
      If you would like a copy, enclose a DOS-formatted
      diskette (any size EXCEPT 360KB) with your order for
      the book. N.B. I can only supply the software in
      DOS format.

      (Please make sure the diskette is adequately protected.
      I've received a few diskettes recently in very flimsy
      airmail envelopes, and of course they were damaged).

     "I used to think I was sensible, that makes the
                     truth even more incomprehensible..." - ABBA

        (send email for a list of alternative addresses =8^)

Hi all!
I have just been reading some old QST's that I found in the Uni library and came
across an article published in 1987 talking about OSCAR 25 years on.
It mentioned that by 1991/92 there would be some new geostationary
OSCAR.
Now Does anybody know anything about this? and if so what/how would

you work with? Could you use say an FT5200 transceiver?
The article also said you might be able talk from Melbourne to Athens via
the two satellites. Is this true?

Any help appreciated
Regards
Jose

At one time I had a copy of a program similar to "poor man's packet" for the pc. I inadvertantly erased it in my last hard drive rebuild and can not find the documentation for it or the name of it. What is it called and where on the net might I find it? Thanks in advance.

Personally, I intend to print out that information and wave it in front
of the manager of the local Ham Radio Outlet store. (And maybe at Computer
Literacy bookstore for good measure.) Maybe if a bunch of us do the same
thing at various HRO locations, they'll take the hint and order some.
(The masochists among us may even want to try it at Radio Shack. :-))

Oops, forgot to mention: the PI card would have no problem running at 112
or 125Kbps... or well beyond, for that matter.

The most recent (arrived 2/18) SunExpert magazine has a short article
on amateur packet radio. I just glanced at the article Friday, but
the author (the anonymous "Mr. Protocol") compares the existing ham
radio BBS network with Usenet (obviously, a disappointing comparison).

I recently purchased an MFJ-9600 modem for a MFJ-1270 TNC

for use on packet. The modem's manual says to set the deviation at 3.5 khz. It goes on to say that the modem will provide up to 8 volts of TXaudio. Well, mine starts distorting badly at even 1.3 volts. I am using the modem with an Alinco DR-1200t. There was a message about this combination a while back that said something in the way that the voltage needed for proper deviation was 3.5 volts and that a buffer amp of some sort was needed to use them together. Does anyone know anything more about this or where to look. Alinco has been very helpful, as has MFJ, but neither of them will commit to anything about interfacing with the others product. The tech-rep I spoke with at MFJ said that they had successfully used that radio with the modem after changing the IF filter. Alinco says that they have changed the design since then and a new IF is not needed. I am only decoding about one out of six packets on receive and nobody is decoding my station at all. I have not tried to set the deviation yet but will have access to service monitor this next week so any info about this buffer amp that may be needed would be helpful. I've dropped over $400 into this project so far and have yet to make an connection with it.

I've had similar results with the DR-1200 connected to the MFJ 9600 modem, the

K9NG modem and the newer TAPR 9600 modem. Tests were done with the DR-1200 wired as suggested by Alinco and then later as suggested by a posting here on Usenet where one lifts the VCO assembly to get at the varactor. At no time did I ever see packets transmitted or received better than 50% of the time. While one could claim that it 'works' I wouldn't call it useable.

Joe why is it disappointing? I thought they both shared common attributes
like NOS TCP/IP. What should they have compared amateur packet to, RTTY,
AMTOR? Would the readers know what they were talking about? Just
curious why you were disappointed. Regards, Terry

The WNOS4 TCP/IP NOS software from DB3FL has a news reader and poster
built in. You don't require any external programs in order to read
and create news articles.

    nntp read <newsgroup> [start_article] [end_article]

    Calls the news reader to read articles in the specified
    newsgroup. Optionally, the first and last article in that
    group to be read may be specified. Index files are updated
    automatically after finishing the session.

    nntp post

    Calls the interactive news posting program. This then prompts
    for all header information and provides a simple line based
    editor to compose the message in. On exiting, the article is
    posted to the newsgroup and all index files are updated
    automatically.

Hope that helps,

Mike (G6DHU)

Lines: 19

Hi, One quick question. I have the MFJ-1278 with V 3.4 ROM's.   I want
to run 9600 baud packet. I have the TAPR-II modem.

The V3.4 ROMS do NOT support 9600 baud packet. The current version of
the ROMS is V3.6. Does anyone know if that version supports 9600
baud packet? I don't want to order them if they do not, but I have
tried calling their tech support for 4 DAYS!!!!!!!   MFJ's phone
support is useless.

(The order line is free, but the lady did not know what ROMs do what.)

Thanks in advance for your help!

Do you mean the "PacketMac Modem", #2 below?:

Here's what I know about cheap packet systems:

Summary of Inexpensive 2m Packet Systems:
---

1. For PC-compatibles:

   A. Poor Man's Packet: (the authors are on internet)
      I. Page 8 August 1991 73 magazine.
      II. Anonymous FTP: helios.tn.cornell.edu (128.84.241.2),
          /pub/PMP/pmp11dsk.zip .

   B. BayCom revision 1.50a software and either BAYPAC or use the
      TCM3105.ZIP Postscript schematic:
      I. Review: December 1991 issue of 73.
      II. Anonymous FTP: WSMR-SIMTEL20.ARMY.MIL (192.88.110.20) or
          mirror sites like OAK.Oakland.Edu (141.210.10.117)
                            wuarchive.wustl.edu (128.252.135.4)
                            ftp.uu.net (137.39.1.9)
                            nic.funet.fi (128.214.6.100)
                            src.doc.ic.ac.uk (146.169.3.7)
                            archie.au (139.130.4.6).

          I have used wuarchive.wustl.edu (128.252.135.4):
            /mirrors/msdos/packet/tcm3105.zip and
            /mirrors/msdos/packet/baycom15.zip
       (=BayCom revision 1.50)

      The later revision 1.50a is available from ucsd.edu :
      /hamradio/packet/baycom/baycom15.zip (168789 bytes)
      and also an ENGLISH manual for rev 1.2:
      /hamradio/packet/baycom/manual.zip (42424 bytes)

     Note: Some older versions of the tcm3105.zip schematic
       have 2 R2s. I think the "R2" connected to the

CTS line should be corrected to R3, a 2.2K ohm.

2. For Macintosh:
   PacketMac Modem: (the author is on internet)
   Page 8 October 1992 73, and errata page 54 November 1992 73.

3. Commodore 64: I was told:
> Digicom 64 in the August 1986 73 (date ??).
>
> The software is public domain and is usually bundled with a
> "kit," PCB, hard-to-find parts, etc.; from some hams that
> translated the original documentation from the German.
>
> A more-or-less accurate list of the guys that can supply the kit
> is listed in the ARRL publication, "Gateway to Packet Radio."

Notes:
---

1. I have only used Poor Man's Packet, but hope to try BayCom soon.

2. If you have Internet mail but not FTP, try the FTP mail server:
   send a mail message with the subject "help" and a single message
   line "help" to ftpmail@decwrl.dec.com.

3. I have uploaded the "AX.25 Amateur Packet-Radio Link-Layer
   Protocol, Version 2.0 October 1984" specification as ax25.doc in
   /hamradio/packet/ on ucsd.edu . If you have problems getting the
   file, I'll be pleased to email it to you.

BayPac BP-1, "$49.95 + shipping" (73, Jan 1993, p54):
    Tigertronics Inc
    400 Daily Lane

Subject: Connecting Kenwood TS-930S for Packet & RTTY
Date: 22 Feb 93 20:27:23 GMT
Organization: UCSD Usenet Gateway
Lines: 17
Message-ID: <9302222027.AA24282@hanover-crrel.army.mil>
NNTP-Posting-Host: ucsd.edu
Originator: daemon@ucsd.edu

I recently bought a used Kenwood TS-930S HF tranceiver. I want to connect it to my PK-88 packet TNC. The 930's instruction book does not cover this issue at all. Additionally, I want to do RTTY mode with the 930. This subject is only mentioned in the manual, but they do not describe what equipment is required to connect the 930 to a terminal/computer.

I would appreciate it if someonw can tell me how to get packet and/or RTTY up and running on this system.

Please reply to:
     Internet: trachier@hanover-crrel.army.mil
     Packet: N1MEU @ wa1wok.nh.usa.na

Thanks in advance,
Gary.

Mike-

I understand that the Radio Shack Speaker-Microphone fits both the HTX-202,
the Icom IC-2AT and some Yaesu handhelds. I suggest you assume yours is in
this category, and procede with installation for an IC-2AT. As I recall,
it was a matter of just plugging in the cables that came with the HK-21.

When you get it working, I assume you know that deviation is set with a
small potentiometer inside the HK-21. Mine worked without adjusting that,
although I did touch it up later.

You will find that the HK-21 generates a lot of hash, since it has no

shielding at all. It seems to have a harmonic from one of its oscillators, that falls near 145.01 MHz. The only way to hear weaker stations is to use an outside antenna, or at least increase the distance between the HK-21/computer and the handheld as much as possible.

Frequently Asked Questions for Amateur Packet Radio

Version 1.13 - Last modified 2/21/93

This document is for unlimited distribution.

Please send corrections and additions to:
   packet-faq@wattres.sj.ca.us
Which will expand to a list of people who are familiar with most packet issues. I hope. ;-)

The Packet Radio FAQ's will be posted on a monthly basis to rec.radio.amateur.packet. The current version of this document is available via anonymous FTP at ftp.cs.buffalo.edu.

Many FAQ's, including this one, are available on the archive site rtfm.mit.edu in the directory pub/usenet/news.answers. The name under which a FAQ is archived appears in the Archive-Name: line at the top of the article. This FAQ is archived as radio/packet-faq.

There is also a mail server on rtfm.mit.edu, which can be addressed as mail-server@rtfm.mit.edu. For details on how to operate this server, send a message to that address with the word "help" in the BODY of the message.

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small bursts, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc. A copy of that FAQ is also available from ftp.cs.buffalo.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than just your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used as a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the associated circuitry required to convert between RS-232 and the packet radio protocol in use. It assembles a packet from some of the data on

the serial line, computing an error check (CRC) for the packet, modulates it into audio frequencies, and puts out appropriate signals to transmit that packet over the connected radio. It also reverses the process, translating the audio that the connected radio receives into a byte stream on the RS-232 port.

Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF packet, and 300 BPS for longer distance, lower bandwidth HF communication. Higher speeds are available for use in the VHF, UHF, and especially microwave region, but they often require unusual hardware and drivers.

Computer or Terminal: This is the user interface. A computer running a terminal emulator program, a packet-specific program, or just a dumb terminal can be used. For computers, almost any phone modem communications program can be adapted for packet use, but there are also customized packet radio programs available.

A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 BPS data is used over single side band modulation. For high speed packet (anything greater than 1200 BPS), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access). If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the TNC keys up the radio, and sends its packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to

automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the sender's and recipient's amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format 44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AX.25 - Amateur X.25 protocol. The basis of most packet systems. See section 1.7 for more information.

CRC - Cyclic Redundancy Check. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier frequency different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

modem - MODulator/DEModulator. Converts the analog signals into a binary data stream (a series of ones and zeros) for the TNC or a micro-computer. First step in decoding packets. It also converts binary data to analog, which is the last step in encoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

PPP - Point to Point Protocol. PPP is another protocol used for moving IP frames over a serial line. It supports host authentication, and non-transparent serial lines. It also has a standard way of negotiating header (and potentially data) compression over the line. See also SLIP.

protocol - A standard used for intercommunications between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

SLIP - Serial Line Internet Protocol. A trivial protocol for putting IP frames over a serial line to do (potentially) cheap TCP/IP networking. Approximately the same as KISS, except over wireline networks. See also PPP.

SSB - Single Side Band. The radio modulation scheme used for HF packet and satellite packet communications.

TAPR - Tucson Amateur Packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -ed]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

> Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

> I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be passed FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to ensure that rules of message content are followed.

> It's my license if I use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensee's responsibility, one illegal message sent

over the packet radio network could literally jeopardize the licenses of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

> I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup): General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup): General amateur radio discussion. Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup): Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with policies of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup): General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group): A digest redistribution of the

rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

ham-policy@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (Mailing list): Group discussion of technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (Mailing list): Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

listserv@knuth.mtsu.edu has several interesting mailing lists available:

GRAPES-L	Discussions with GRAPES (Georgia Radio Amateur Packet Enthusiasts Society) on 56kb WAN's and the WA4DSY 56kb RF modem that they distribute.
TENNET-L	Tennessee's efforts at a coordinated high-speed RF packet network
GRACILIS-L	Discussions on Gracilis tcp/ip packet equipment. Includes some of the people from Gracilis.
KA9Q-UNIX	Discussions on porting and using various versions of KA9Q Unix/Xenix NET/NOS under any of a variety of Unix/Xenix variants.
TNV-HAMS	General discussions amoung email connected amateur radio operators in and surrounding Tennessee

Send a message with a body of "HELP" to get help from the list server. Also, Internet users may now INTERACTIVELY work with the ListServ there by:

telnet knuth.mtsu.edu 372

or

telnet 161.45.1.1 372

For all lists at ucsd.edu, archives may be found via anonymous FTP at ucsd.edu. Some listserv groups also have archives. Send the command 'help' to the group's listserv for more information. Digest mailings

for the ucsd.edu discussions are also available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

Terry Stader (KA8SCP) <tstader@aol.com> maintains a list of Mac packet-related software, and posts it periodically (somewhat less often than monthly) to rec.radio.amateur.packet.

2.2 What anonymous FTP sites are available for getting packet radio information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu

Primary distribution site of KA9Q's derived TCP/IP packages. Also, general packet radio information in the /hamradio/packet subdirectory.

wsmr-simtel20.army.mil

Very large collection of amateur radio software.

wuarchive.wustl.edu

Mirror site of Simtel20 archives. Unix directory structure, which is easier to use then the simtel20 archive.

ftp.cs.buffalo.edu

Supplimental archive site for amateur radio information. Contains current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov

Packet software including Baycomm, ROSE, G8BPQ, NOS, etc.

akutaktak.andrew.cmu.edu

SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
SoftKiss is an init/cdev/driver that allows a MAC to do packet using a Poor Man's Packet modem.

sumex-aim.stanford.edu

NET/Mac is the port of KA9Q's NET program. It doesn't have nifty features like scrolling or saving the windows, but the individual sessions can be recorded into a file.

2.3 How do I contact the ARRL via electronic mail?

There are various addresses at ARRL HQ, but the most important one is probably info@arrl.org. That is where general information about the ARRL can be acquired. This address reaches a person, so you'll have to specify what/who you're looking for.

2.4 Are there any gateways for mail or news between Internet and Amateur Packet radio?

Internet / Packet Radio BBS Gateway

Jim Durham, W2XO, maintains a gateway between Internet and the Packet radio BBS system.

To mail from Internet to Packet:

1. Mail to: "bbs@w2xo.pgh.pa.us"

2. Make the first line of the text a Packet BBS "send" command, ie: SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the Internet mail becomes the "title" line of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message sent FROM Internet TO the Amateur Packet Radio BBS system. Messages should be of minimal length and appropriate content. Read Section 1.9 (Do's and Don'ts: Rules and Regulations) regarding appropriate usage of packet radio for more information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in the gateway alias list. If you want to mail from packet to a specific amateur on Internet, send mail to 'durham@w2xo.pgh.pa.us' (Internet) or 'W2XO @ W2XO.#WPA.PA.USA.NOAM' (Packet BBS mail) with his/her amateur callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NOAM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.pa.us'.

LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the

gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network

schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if its call was in the digipeater field, would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections with fewer timeouts, because acknowledgments are only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM station as if connecting to any other packet station. From there, he can issue commands to instruct the station to connect to another user locally or connect to another NET/ROM station. This connect, then connect again, means that to a user's TNC, you are connected to a local station only and its transmissions do not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM doesn't use all of the AX.25 protocol. Instead, it uses special AX.25 packets called Unnumbered Information (UI) packets and then puts its own special protocol on top of AX.25. This is again used to increase efficiency of its transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network. However, if band conditions such as ducting occur, ordinarily unreachable nodes can be entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

ROSE is another networking protocol derived from X.25. Each ROSE node has a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

ROSE's use of static routing tables ensures that ROSE nodes don't attempt to route packets through links that aren't reliably reachable, as NET/ROM nodes often do. However, ROSE suffers from the inability to automatically update its routing tables as new nodes come online. The operators must manually update the routing tables, which is why ROSE networks require more maintainance.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBSes use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBSes, many TNC makers have developed Personal BBS software to allow full service BBSes to forward mail directly to the amateur's TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

The subject says it all.
I'm trying to compile NOS using Turbo C++ and Turbo Assembler.

After making a few not-seeming-to-be-critical changes to the
makefile, I was able to compile, assemble, lib, link everything.

Unfortunately, the executable does not work. In fact, it doesn't
seem to execute 'main'. It just hangs.

I have not touched the distributed source other than the makefile.
The machine runs the executable off the net with no problem.

Can anyone shed some light on this? I notice that Phil Karn is using
the more expensive Borland C while I'm using the cheaper Borland
Turbo C++. Has anyone else succeeded with TC++?

Any advice woulod be greatly appreciated. Thanks!

-Ben Mehlman KB2ERP

PS: If there are people out there who have been making significant
source changes to NOS, who would like to chat about it - mail me! If
you send me your phone # I'll give you a call!

You must know the BBS with which your correspondent is registered.
You register with a local BBS. Then you can use SP (Send Personal)

to address messages, as for instance SP KC2DG@WA2AAR.NJ.USA.NA
for me to send a message to my son. It will usually be much much
slower than e-mail. 73 and GL

Hello all,

As i will change job at work, i will lost my Internet acces next
mounth.

I want to get a good copy of TCPIP software, and i found in @UCSD.Edu
via ftp many soft about it, but.... i can get a copy of all of it.

So, whitch are the soft i must get ?

After, i will work on PC, or perhaps on bad BULL machine on Unix..

Many thanks for your help.

Subject: GRI NOS an AX25 bbs

Message-ID: <32194@castle.ed.ac.uk>
Date: 23 Feb 93 10:33:15 GMT
Sender: nntpusr@castle.ed.ac.uk
Lines: 32

I am having problems with getting GRI NOS (version 2.0m) working
with my local AX25 bbs. From the manual I gather that it is possible
to have NOS automatically forward specified mail to an AX25 bbs using
a /spool/forward.bbs file. As far as I can see I have set this up
correctly but am unsure on how to proceed. My /spool/forward.bbs looks
something like this,

gb7abc
connect 2m gb7abc
gb7abc
g1abc
g7def

Where gb7abc is my local bbs and gb7abc,g1abc and g7def are people who I
want mail to be sent to this bbs. When I try to send mail to g1abc it
simply takes this as a local user and mails the message locally. If I
specify to send the mail to g1abc@gb7abc SMTP says that it doesn't know
who gb7abc is (or something like that). So the questions are basically
is the above correct ? If it is how do I use it ?.

Whilst on the subject, I know it is also somehow possible for an AX25
bbs mailbox to send mail to your NOS box. Presumably this relies
heavily on the ax25 mbox being able to send messages in a sensible manner.
Does anyone have any experience of this ? How well does it work and does
anyone know if it is possible to do this with an FBB ax25 mbox ?

Thanks for any help/advice,
73s,
Justin

Well, we do here in Europe, using 7plus. It's a bit of a controversial subject - there are lots of people both for and against it, as it uses up quite a bit of forwarding space. Still works though, especially well for smallish files.

> 1) TOO MUCH DATA FOR SUCH A SLOW MEDIUM. I would assume this is
>   the primary reason, but if people used small programs, maybe
>   3-4K, it wouldn't be any different than a message.

We split longer files up into chunks of 4 or 5K of code. 7+ does this automagically.

> 2) PEOPLE DON'T KNOW HOW. Maybe, But UUDECODE is a good standard
>   to use, and you could use the COMT version on the PC which would
>   allow you to send the UUDECODE.COM file in the message. (2K)

Most people do here. We use (as I said) a system called 7 plus (7+) which is like UUENCODE, but which uses the full 8-bit extended ASCII set. It's a whole lot more efficient than UUcode. Error files are generated automatically and get sent back to the originator, who then runs it through his system to generate a corresponding correction file.

> 3) NO COMMON DESTINATION. True, but I would be willing to bet
>   that there are more PC clones out there on packet than any
>   others. Plus you could send code for any machine format.

Virtually everything that appears is for the PC, tho the occasional programs do appear for the Commodore Meagre <grin> and the Archimedes.

> 4) WOULDN'T INTEREST EVERYONE. No article out there now interests
>   everyone.

It doesn't. But people don't have to download it if they don't want it. It's polite to keep things short though, especially if they're sent internationally. Our HF gateway sysops get a bit miffed by big 7+ files. Solution? Send them only @GBR and everything is lovely! (Well, almost).

>Perhaps it would be better to send a public message explaining the
>software you had, and when you received responses, send out the software
>as personal messages only to those interested. Perhaps this is already
>being done.

This is being done. But if there is more than one person wanting the software, it's more efficient to send it as a bulletin anyway - then only has to go everywhere once.

>What do you think?

Fine, as long as things are kept short. 15 parts is the definite maximum, but there are people who insist on sending out 150K files by 7+. Let's face it, snail mail is more efficient for that sort of thing as far as the AX25 net is concerned.

This is a followup on my problems getting KISS mode to work correctly on my
MFJ-1278, newly upgraded with 3.6 PROMs. My (very) old PROMs pre-dated KISS, so
this is my first experience trying to get it running.

I've debugged it enough to find that the problem is that *every* packet appears
to have exactly one leading NUL byte, according to the hex dump from NOS. If
things are shifted over by that one byte, they appear to decode correctly.
Trouble is, I have no idea where the spurious NUL is coming from. Any ideas? It
would be trivial to build myself a verion of NET.EXE which gobbled the NUL, but

that's cheating :-). There must be a parameter I've missed.

February 20,

Moscow, Russia,

JV "TETRA".

Dear Sir,

Thanks for displayed interest.
Our company is young and growths quickly.
We want to begin a joint business with any
west partner at the sphere of import CDs to Russia.
This market at our country is one of the most attractive
and it promises a good profit for companies which want
to sell CDs. Now we have a lot of tenders and offers from
all of the regions of Russia from small trade companies
which want to buy CDs from us. Certainly, we need a lowest
prices and we are ready to buy not new CDs. The most popular
music at Russia is Classical Rock. The less popular are Jazz,
Classics, Avangard.

We can transfer USD to any reliable west Bank. We think that
for the first time the total amount of USD must be about
5,000-10,000.
We hope for your response.
                    Sincerely,
                           Andrey Sumarokov,

I am running the new wg7j nos. I have created a virtual drive E where I keep th
e nos files, including the autoexec.nos file. When I run the j7nos file (nos.e
xe) it does not seem to be able to find my autoexec or domain.txt files.

What shoudl the command line be?

Is there a comprehensive doc file on this version of nos?(

fiddler@concertina.Eng.Sun.COM (steve hix) writes:
|If I were to be set up for operating packet on 2m, and someone I
|wanted to communicate with was also set up for it...
|How do I get my message(s) from here to there? Do I have to
|determine a repeater path from here to there, or do I just send it
|into the ether (and hope)?

Depends on where the distance. You could connect directly to her
TNC, or via one or more digipeaters. You could connect to a packet
BBS and send mail to her mailbox on the same or another packet BBS.
Etc.

|A complete description of the process would be nice. A pointer to
|an ARRL (or other) publication would be OK. email is fine.

There are books on the subject, but I'd like to plug my favorite book
for getting introduced to any new ham operating topic, and that's the
ARRL OPERATING MANUAL (I think) . . . a large format paperback that,
like the ARRL ANTENNA BOOK, costs under $20. Besides extensive
charts, maps and tables in the last chapter, it contains a chapter on
each of several operating modes or topics, and the chapter is an
excellent introduction. If you want to go further, then you can get
deeper book on a specific topic (or at least you'll know enough to be
able to ask intelligent questions on the net :-)). Chapters I have
perused cover topics like packet, satellite, dx, contests and awards,
traffic handling, vhf/uhf, etc.

The chapter on packet, for instance, not only tells you the basics,
but gives information in detail about how to use the standard BBS and
DX cluster systems you might encounter.

     /JBL

(Disclaimer: I'm a satisfied owner/reader/user of the book and nothing
else (well, I'm an ARRL member too).)

February 20,

Moscow, Russia,

JV "TETRA".

Dear Sir,

Thanks for displayed interest.
Our company is young and growths quickly.
We want to begin a joint business with any
west partner at the sphere of import CDs to Russia.
This market at our country is one of the most attractive
and it promises a good profit for companies which want
to sell CDs. Now we have a lot of tenders and offers from
all of the regions of Russia from small trade companies
which want to buy CDs from us. Certainly, we need a lowest
prices and we are ready to buy not new CDs. The most popular
music at Russia is Classical Rock. The less popular are Jazz,
Classics, Avangard.
We can transfer USD to any reliable west Bank. We think that
for the first time the total amount of USD must be about
5,000-10,000.
We hope for your response.
                    Sincerely,
                           Andrey Sumarokov,

Baycom and YAPP; something to look for

This morning on our local packet BBS, a message from:

Mr Guy Marchal ON5FM@ON7RC.BEL.EU reported that YAPP now exist to run on
a Baycom. It is made by Mr Frederic Aguilar FD1TKW.

The message said that those 3 files are available:
        B-YAPP.EXE
        B-YMONO.BAT
        B-Y.BAT

The message never said where and when we can get it???

It would be great for all Baycom users if somebody can contact them and put
this software on the Internet if possible. Without yapp, I can't even
transfer a file (..) with my baycom... My site has an anonymous ftp server
and I could put it in there if I can get a copy.

Clem

Its here! Finally......

Now available, beta test version of the AA4RE BBS. This version is
labelled 2.1C. Highlights are:

  -- Converted to Borland Pascal with Objects (TP7)
  -- Added DPMI mode version for breaking the 640K barrier (see DPMI.DOC)
  -- Added "CONNECT" operand on "X" command for force a connect even if the
     other station is connected. See OPERATE.DOC
  -- Added tolerance for tabs in headers
  -- Added better handling of .CC lists in action files
  -- Added the ability to attach a file to a message (see ATTACH.DOC)
  -- Added RPROMPT/NORPROMPT option on "T" command in PATH files to control
     if the reverse forward prompt will be sent (See FWD.DOC)
  -- Added new actions TELL_AFTER_SUBJECT and TELL_AT_END for informing
     the user about his message (See ACTION.DOC)
  -- Faster BBS<->BBS forwarding compatible with all BBS
  -- Ports speed can now go to 56kbps
  -- High speed flow control for modems
  -- Command aliasing (see ACTION.DOC)
  -- New server options (see SERVER.DOC)
  -- Numerous fixes for garbage headers

To obtain a copy, FTP from tomcat.gsfc.nasa.gov

There are three zip files

    BB21C   ZIPBIN   * -- Doc, common utilities, etc
    BB21CN   ZIPBIN   * -- "Real mode" DOS programs
    BB21CP   ZIPBIN   * -- "Protected mode" DOS programs. Requires 286
                             or better machine with minimum 1MB storage

Also a new MBBIOS (V3.8) for high speed links is available. This
is MBBIOS3X.ZIP.

I have also loaded out all of W1NPR's servers.

Roy, AA4RE
enge@almaden.ibm.com

P.S. New home wanted for beta test versions, etc since tomcat is going
away and ucsd.edu is getting full. Please drop me a note directly if
you volunteer.

Hello All

>>It goes on to say that the modem will provide up
>>to 8 volts of TXaudio. Well, mine starts distorting badly at
>>even 1.3 volts.

I have 3 three older 1200's and three 9600 baud MFJ 1270's and found the same thing. They don't work better than 50% of the time. I talked with a Tom at MFJ he said the manual is wrong and should be 0.8 volts. He has used the Alinco mod, with the low output with no problem. After the frequency of the two radios were set the same. It is apparently critical because of the narrow IF filters.

>>The tech-rep I spoke with at MFJ said that they had successfully used
>>that radio with the modem after changing the IF filter.

I have ordered 3 IF filters and the service manual, when they arrive we will try and set the frequency and see if there is any improvement, if not we will swap out the filter.

I hope to do this next weekend. I will post the entire escapade shortly after that.

OK, JIm, soon as Cora comes in I will ask her to fax it. Hope it comes out OK, it is a xerox copy and not the best. I have tested the Mac fax only locally, can't do it for the present paper unless I scan it which is not feasible. We received snowover the past week in increments of several inches, have a pretty good cover now. With this snowmelt simulation, we can even get rid of it next month. all the best, dick

If you ring the Kenwood tech support line, they will send out a technical note on connecting Kenwood tranceivers to TNCs and RTTY modems.
However, my experience with a friend's 440 has taught me that there are better ways to connect them than are described in the tech note. Using the acc2 socket and utilizing the mic-mute is a neater and simpler solution. (You need to isolate the internal PTT line from the mic-mute line by a diode or transistor).

Subject: A "*** Done" Question.
Summary: Space in front of *** Done?
Keywords: spaces *** done
Message-ID: <C30K5t.Apu@zero.com>
Date: 25 Feb 93 16:51:25 GMT
Distribution: na
Organization: Beyonet - Zero Network
Lines: 36

Hi, this is mainly directed to BBS programmers but others are allowed to read this :-) hihi. I am newly into the BBS world and would like to know if this is common or not. Many BBSes including NOS use the *** Done at the end of a fwding cycle. I have no problem with that.

The problem is what if a BBS namely "PRMBS" BBS sends out a *** Done with a space in the first column? My software rejects that with a bad command message. My point is, what is the norm or standard? Is this a Bug to send out commands with a space in front of them?

Example:

RLI NOS etc etc send:

*** Done

PRMBS sends a:

 *** Done
^
|
 The space is ignored by some bbses but not mine. What is the correct
 method of sending BBS forwarding commands? With or without a space,
 that is the question :-).

Thanks in advance, I hope your input will clear this up.

73 - Steve

The paKet terminal program has some fairly complete on-line help files
covering the 1.1.6 stuff (actually I believe it is for the PacComm
variant).

I just uploaded to ucsd.edu the files doc2118.zip and tnc2118a.zip
(/hamradio/packet subdirectory) which are the command reference and hex
eprom code respectively for version 1.1.8a. They are available by
anonymous ftp. TAPR has a printed 1.1.8 booklet ($5.00) available also.
The doc2118.zip file has the same information which hopefully is still
decipherable after conversion from WP format to ASCII text.

In addition, TAPR offers a bare TNC-2 p.c. board which comes with a disk
containing the hex code for both the firmware and state machine eproms
(also a KISS-only image) plus the assembly and system manuals. The
system manual contains all of the 1.1.8 command information. The disk is
available separately from the board for $2.00.

I have had a number of replies to my original post requesting opinions of the FT290 for packet and satellite work, so it would take a while to reply individually. Thanks to everyone who did respond, however.

It seems that the 290 (either R or RII) is just what I want, so now I just have to get one - maybe this weekend at the Gosford field day with some luck!

Thanks again...

Kerry, I got your email, but mail to you at kimes@bcstec.ca.boeing.com keeps bouncing. It seems that the problem occurs at atc.boeing.com, which complains that kimes@bcstec.ca.boeing.com is an unknown user. Is there another address I can mail you at ? I have some info that may be useful.

I wasn't disappointed in the article -- in fact I was pleased to see
packet radio getting some nice press. I do think that comparing
the existing packet radio network to Usenet will usually result in a
disappointed P.R. user.   I think the author was correct when he
said that the existing P.R. network more closely resembles the
dial-up BBS world.

I don't recall any reference to TCP/IP or any of the other advanced
networking experimentation going on. For example, I saw no mention of
the (small) group of hams using NNTP to exchange news over packet radio.

I think the readers of SunExpert could relate to TCP/IP, NNTP, RIP, etc...
just as well as they could relate to X.25.

I'm new to packet but I have read the FAQs...

from what I understood, it is possible to use your radio at home to
connect to the INTERNET (and therefore anywhere else practically) via packet?
If this is the case, is the same also possible in the UK

The HP95LX runs a slightly modified version of KA9Q very nicely, thank
you. One caution, though: the serial transmitter eats batteries.

I don't think a PCMCIA TNC would sell well; there aren't any palmtops I'm
aware of yet that have Type II slots, and while there are Type I modems,
there's quite a bit more market for those, and they're very machine
specific (because they have to run special software to talk to the modem
as a memory-mapped device, since all Type I supports is memory).

(BTW, does anyone know if the mods I made for the 95's serial port got
folded into the stock KA9Q [or variant thereof] software? They should work
OK on normal machines... If not, I'll pick up a current copy of one of the
packages' source code, or get with any or all authors and describe the
necessary mods.)

Packet doesn't work this way, at least not completely. There's no call setup negotiation in the packet world. Packet can be sent two different ways, Virtual Circuit and Datagram. It's theoretically possible to negotiate a VC connection speed, but with multi-connects or datagrams the modem has to be able to decode every packet it hears. That makes negotiated speeds a problem. Normally different speeds are used on different frequencies and operators set them manually to match the other stations on the channel.

The two basic speeds are 300 and 1200 baud, both based on the half duplex Bell 202 standard tones. 300 baud is used on HF and 1200 is used on VHF due to regulatory issues and practical multipath issues at HF. Kantronics introduced their 2400 baud modulation scheme some time ago and other manufacturers have followed it so that all 2400 baud modems will talk to each other. Some TNCs have dual modems and will respond to either Bell 202 1200 baud or to 2400 baud Kantronics format packets. Origination speeds have to be selected manually.

Above 2400 we have the K9NG inspired 9600 baud modem. The most common implementation is the one by G3RUH. Again there are TNCs that can support this modem as a secondary modem and select downwards to Bell 202, but they aren't common. Also, at this speed most voice grade radios need modifications to work properly.

As we go to the higher speeds, we must discard the voice grade radio approach. At 19.2 kilobaud, most users are directly FSKing special purpose radios such as the Kantronics D4, though some are using the Kantronics 19.2 kb modem which includes a scrambler to prevent bit bias. When you go to the GRAPES 56 kilobaud modem, the modem *becomes* the radio. This unit uses a modulation scheme called MSK for Minimum Shift Keying. It includes a scrambler and a tracking data detector

that will handle off frequency and drifting signals at UHF. That's as
fast as available equipment supports today.

There are faster systems in use experimentally. The GRAPES modem
can be speed doubled to 112 kb, and there are experimental 100 kb to
1 megabaud microwave radios in operation on the West Coast. Finally,
a few hams have experimented with ethernet over microwave at 10 GHz.
This gives a potential data rate of 10 megabits per second.

>As a packet protocol, EC (error correction) is inherent in the protocol,
>correct? Would a TNC with builtin DC (data compression) (effectively) be
>ruled out because of the FCC restriction on "clear text" transmission? Or,
>would it be ruled out because of the need of the remote modem to maintain
>an updated compression table which isn't feasible?

The packet protocol in use at the link level, AX25V2, does not support
error correction. It does support error detection. When used in VC mode,
it operates as an ARQ protocol with the receiving station sending ACKS or
acknowledgement packets for correctly received frames. The transmitting
station will resend any packets for which it doesn't receive an ACK within
a specified timeout interval. In essence this is similar to the venerable
XMODEM protocol used for file transfer by landline systems. When used in
datagram mode, AX25V2 does not do ACKs and so is not an ARQ protocol.
That function moves to a higher level in the protocol stack, such as
the TCP level of the TCP/IP protocol suite that is often used by amateurs
on top of the AX25V2 link layer.

New schemes, called Pactor and Clover are in use at HF that do include
elements of FEC, Forward Error Correction, allowing the receiving station
to reconstruct damaged frames. At VHF and UHF the channel error rate is
usually low enough not to warrant the overhead of FEC schemes. Either the
frame gets through undamaged, or it's so totally clobbered by a collision
that FEC doesn't help.

Data compression, either on the fly or compressed file transmission,
is perfectly legal on the amateur bands *if* the compression is meant
to facilitate communications and is not intended to obscure meaning.
This is not considered encryption under the rules, IE it is still "plain
text" assuming you have the proper decompression software. Encryption is
generally illegal except for certain telecommand functions. Any published
scheme that can be reproduced by any other similarly equipped amateur is
perfectly acceptable. Even systems that are not in wide public use are
acceptable if station records are kept of the compression algorithm to
allow the FCC to decompress any transmissions they may have intercepted.
Systems that require confidential private keys are *not* acceptable.

I haven't heard of anyone using on the fly compression, and don't know
of any commercial implementations for TNCs, but compressed binary file
transmissions using schemes like PKzip are routine. I think I've heard
of some forwarding BBS systems using message compression, but I don't
know if it's done on the fly or in advance of transmission.

I hope this summary is useful.

Gary

Hello all. I am a tech. (n7xla) in Missoula mt. I have not
gotten on Missoula Packet yet. Is there a packet gateway to the Internet?

This way I can send E-mail to my friend, kd7hp who has a packet BBs in
Missoula. I have heard of a gate in Penn. however being that I just got
on I saw no FAQ post. If there is no formal gate, would someone
handle my msg traffic? Please e-mail me @petey@selway.umt.edu

thanks

I am going to purchase a Packet Data Engine this Dayton. If anyone is
interested, I would like to develop some new software for it.
Preferrably something to do data compression at high speed. Any takers?

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source
of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and
to news.answers every two weeks. You are now reading the first article, which
explains what rec.radio.info is, and answers some Frequently Asked Questions.
The second article is titled "Submission Guidelines", and you only need to
read it if you want to submit an article to rec.radio.info.

 -- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with
a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit
chat about radio. Rec.radio.info will contain informational, factual articles
only. Follow-ups are redirected to an appropriate other group, and further

discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it was decided to create the group as a moderated newsgroup.

-- Why are messages almost always cross posted to rec.radio.info?

It provides a "tag" for each article to be assembled into a filtered presentation in rec.radio.info (even with cross-posting, only one message, with a unique Message-ID, is propogated across the net). This tag also facilitates a pre-existing method of dropping or cancelling the articles locally within the discussion groups if you don't want to see them. This accommodates individuals who want to separate the bulletins from the discussions, discussions from the bulletins, as well as those who are adamant about not reading another newsgroup and wanted to see everything all in one basket.

With the total size of Usenet (in number of newsgroups and total traffic) doubling every year or so, this is no insignificant contribution to reducing information noise and chaos. Making the discussion groups a catch-all, and making extra newsgroups filters on that catch-all, is also the most realistic way to implement such a scheme (It's not intuitively obvious what the charter, contents, and general appropriate topics for each and every newsgroup are. Seeing FAQ's and charter/intro postings in the home newsgroup is beneficial for new readers).

By cross-posting one only is adding a few tens of bytes to each bulletin (to specify the extra group on the Newsgroups line), but are adding the capability for very powerful filtering features available on most news servers and readers. Your local news guru could probably explain these features in more detail.

-- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

-- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:

rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

   rec.radio.swap may be more deserving of the posting in any matter.

   Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- I do not have access to news, how can I get the information posted to rec.radio.info?

brian@UCSD.EDU (Brian Kantor) has kindly supplied a mail list server for rec.radio.info. Non of the articles will be digested, due to their size, so you will receive individual mailings for every article posted to the group.

Mail sent to radio-info@ucsd.edu will be forwarded to the moderator and thus is an alias to rec-radio-info@ve6mgs.ampr.ab.ca

To subscribe and unsubscribe via the listserver; the format for that is

```
     sub address radio-info
     unsub address radio-info

where 'address' is your full mailing address. Send this request to

     listserv@ucsd.edu

Note that the server will automatically delete any address that bounces mail.
If you leave the address portion blank, it will try to deduce your address
from the mail headers. This may not work if you are on bitnet, milnet or
some other non-Unix host, so it is recommended to put your return address
in any case. For example:

     sub mymailbox@myhost.mydomain.mil radio-info
or
     sub MEMEME01@DMBHST.bitnet radio-info

or something like that.

 -- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
     - unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
     - nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
          saved to /pub/dx/text/rec.radio.info currently stored as
          numbered files.

Effectively this means that anything you post to rec.radio.info will be
permanently stored, so your work will not be lost.

 -- I have a regular posting with timely information, is there a way to
    speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are
willing to take responsible people and provide them the means of posting the
articles directly from their site. We will try everything we can as we fully
realize that DX (distant signal) and astronomical data can be somewhat
transitory. We are also willing to allow regular posters of information the
same courtesy, even if the information is not as timely.

We refer to this as self-moderation, which is partly based on the model for
news.answer. This requires co-operation and good will to be beneficial to
the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to
suggestions.

I thank the following individuals for their input into this article:
     The rec.music.info moderator ...
     The rec.radio.broadcasting moderator Bill Pfeiffer wdp@gagme.chi.il.us
     Paul W. Schleck, KD3FU pschleck@unomaha.edu
     Ian Kluft, KD6EUI ikluft@uts.amdahl.com
```

I have used the White Pages server here in the states, and although it
isn't perfect, it is a lot better than nothing. Does anyone know if
there are similar servers in other countries, particularly Great Britain
and Germany?? I would love to find out if some of my old acquaintances
are currently reachable using packet radio.

Hi I've grabbed the ka9q source from ucsd.edu.
The makefile requires rcs which I presume is
a release control system. Can anyone please tell me where
I can find a copy of rcs.exe for DOS.
Thanks

I have a similar question: how about a palmtop, a multimode TNC, an HF
QRP xcvr, and a dipole, all battery-powered, in the north woods of
Minnesota? Does this sound feasible?

I just received the resistor mod kit from AEA. I am, however,
to use it because it excludes the H.F. packet mode.

Doe's it change the filters? Why does it effect packet mode?
What improvements will it offer for AMTOR and Packet?

        Reply to: RE>Packet-Radio Digest V93 #39

Having seen the blurb about NosIntro and NosView I thought I would add my two penn'orth.

Some while ago I arranged with Ian to distribute NosView over the Internet (as he does not have accesss) and it was made available on ucsd.edu and on tomcat. As far as I'm aware it is still there on those machines. However I have not received an update for some time and it is likely that a more recent version exists. Having just received a leaflet advertising NosIntro (first I've heard of it) I have replied ordering a copy and also reminding Ian to send me NosView for uploading onto the Internet.

If a new copy arrives I will upload it and post details here.

Hello everybody!

I am rather new to packet so excuse me if this is in the FAQ or is just
something everybody but me knows.
I am building (yes, I don't buy anything readymade, not even a kit, I
design it and then build it!). So I don't own a TNC.
I would like to connect two computers via radio. One is a stationary UNIX
box at home that is routed through a small PC computer to the radio. The
other is a moveable PC computer connected to another radio. I would like it
to be just a point to point connection (if it also can connect to others,
fine but no requirement from my side). I am thinking of running about
100 kbaud and since the UNIX box communicates via TCP/IP I want to use that
protocol. The PC-router could of course encapsulate the TCP/IP in something
else, if only the moveable PC can understand it. (I actually don't write such
programs myself, but rely on ftp-able free software.
Now finally to my question: I think that to comply with regulations my
callsign has to be put into each packet sent. This can not be in the TCP/IP
packets, or ??? So I suppose that AX.25 has to enclose the TCP/IP packets
since it contains a field for the callsign.
How do I do this? Is there such software?

HI OM!

Some time ago I posted article about Amiga's AmiPac programm. There was
a little mistake about where you can find it. The manual says like this,
you can't find this programm any BBS althought it is shareware...
I hope I will get the address soon where to get AmiPac so I can send it
here. I also try to convert my AmiPac version to 7bit so I can mail those
who are interested in. I will write about that too. Version of mine isn't
the newest one.

I'm trying to interface a Yaesu FT-411 HT to a Heathkit Pocket Packet
TNC, so far without much luck. The TNC keys the transmitter ok,
but the transmitted audio seems to be very low. I've tried all the
obvious things, to no avail. This TNC is set up for a 4 wire hookup:
audio in, audio out, PTT, and ground. I can't find any info on this
radio in any of the packet books. Any suggestions? Thanks...

Mike, N4PDY

I have Phils latest version compiled with NNTP (gee, I wish it had POP).

I picked-up a copy of pnews for the PC and it works nice. I just haven't
seen any mention of NOS NNTP knowing how to send news postings. Can it ?
Do I need to set anything ?

What's da scoop ? :)

Date sent: 16-FEB-1993 13:23:29

I am trying to set up a drsi type 1 with tcp/ip as was sent with the card.

At present I just want to get the packet driver going, but am having
problems in defining the setup files. I have edited AUTOEXEC.NET as well
as bm.? and it doesn't seem to work.
I get an error msg that says something like :"unable to find device drsi"
and then ther is a string like a0...

if anyone has this sort of setup would you mind sending me a copy of your
autoexec.net as well as the bm. ? files.

Eventually I'd like to set up the ethernet/ or perhaps hf end as well so
any advice there would be greatly appreciated.

thankyou.

I have now checked with 2 local bookstores (includes the one at the University here), and two of Denver's biggies (includes the Tattered Cover). None have the book listed in Books in Print (no surprise there). It is also absent from forthcoming books. None have any information that Dowermain, Ltd. exists. One and all turned up their noses at the ISBN number (wonder what good it is, then?). For the moment, the only hope lies in obtaining the publishers address if you want this book.

Will one of the lucky few on the net that got complimentary copies be so kind as to post Dowermain's address. I'd sure appreciate it.

I hope I have all the information correct:

NOSintro - TCP/IP over Packet Radio, an introduction to the KA9Q Network Operating System

Ian Wade, G3NRW

ISBN 1-897649-00-2

A friend of mine, an active ham, wishes to write some software for use
w/ packet radio. He's not using a TNC, so, he needs to program all the
niceities usually taken care of in hardware..

Specifically, Im looking for a byte-by-byte definition of the currently accepted packet radio protocol. I understand there has never really been a standard layed down on paper, so books on the subject arent all that easy to come by, and i guess he's dealing w/ a time constraint as well.

Thanks..

I am curious why people do not send binaries (software) over the packet bulletin system. It seems to be successful over internet (comp.binaries...), but I have not noticed it on packet. I would guess the main reasons to be:

1) TOO MUCH DATA FOR SUCH A SLOW MEDIUM. I would assume this is the primary reason, but if people used small programs, maybe 3-4K, it wouldn't be any different than a message.
2) PEOPLE DON'T KNOW HOW. Maybe, But UUDECODE is a good standard to use, and you could use the COMT version on the PC which would allow you to send the UUDECODE.COM file in the message. (2K)
3) NO COMMON DESTINATION. True, but I would be willing to bet that there are more PC clones out there on packet than any others. Plus you could send code for any machine format.
4) WOULDN'T INTEREST EVERYONE. No article out there now interests everyone.

What are some other reasons for not using packet for such a distribution? What are the advantages to using it. It seems to me that it would be useful to be able to send simple software this way. For example, I have written a few small programs related to ham radio, such as a CAT interface program for a Yaesu. I would like to hand it out to people as freeware (I imagine that is to ONLY type of software which would be

allowed which could work). I could send it out as one of two small
messages, and after people read the message, they could decode the
software off line and use the program. Sounds useful.

Perhaps it would be better to send a public message explaining the
software you had, and when you received responses, send out the software
as personal messages only to those interested. Perhaps this is already
being done.

What do you think?

BTW - I'm not as interested in doing it as I am in discussing it.

A pair of programs called "chunk" and "glue" are available that will break a file into <5k messages to be sent over the system and "glue" them back together at the other end. It may take a week for all the chunks to traverse a state though, and sometimes a chunk is lost.

> 2) PEOPLE DON'T KNOW HOW. Maybe, But UUDECODE is a good standard

We were using BtoA and AtoB, but uuencode and uudecode work fine too.

Yeah, just mark machine type in the Subject line of the chunks.

> 4) WOULDN'T INTEREST EVERYONE. No article out there now interests
>   everyone.

Yep.

>What are some other reasons for not using packet for such a distribution?

We've been doing it for years. At first we were exchanging compressed
binaries directly, then we decided to take advantage of the BBS network.
We compress the file, usually with PKzip, then BtoA it or uuencode it,
then run it through chunk and send it out as a series of <5k messages.
At the receiving end we put it back together with glue, AtoB or uudecode it,
and decompress it.

Works fine. We had some problems at first with the BBS sysops who wanted
to know why we were sending "encrypted" traffic, but once they understood
there weren't any problems. Of course now we are back to just ftping the
files via the TCP/IP network, but sending files via the BBS net was a
nice hack for a while.

There are some downsides. The BBS net isn't too robust and chunks
can be lost. This makes the entire set of files useless. The BBS
net also doesn't enforce horizons very well and old chunks can float
around forever clogging up the net. The system is also horribly slow
and requires some operator knowledge and software. It was useful, though,
when it was all there was. Now with a sturdy TCP/IP network in the tri-
state area, ftp is a better solution.

> Thank you.

I have had a couple of DSY modems running back-to-back on the bench at 125Kbps (125
because that's what you get with a 8MHz crystal in the baud rate generator, and such
crystals are easy to come by). The mods required can be easily extrapolated from the
info in the DSY docs, with two exceptions:

1) The standard 555 timer chip used as the VCO in the clock recovery PLL won't work
   reliably above 100KHz. It should be replaced with a CMOS TLC555, which has better
   specs.

2) Although the 3-stage LC filter used in the 455KHz IF can be stagger-tuned to provide
   something approximating the 150KHz or so bandwidth needed for the 125Kbps MSK signal,
   the resulting eye pattern is not very satisfactory. I designed a replacement filter
   with quasi-linear phase response, but didn't finish debugging it... one of these
   days I'll get back to it.

   Does anyone know where I can pick up some 4800 baud HAPN modems?
Also, I think that I read somewhere that some radios would run 4800b
with no modifications. Is that a true statement? If so, anyone have
any experiences with running unmodified radios at 4800b? Thanks.

The latest Black Box catalog lists the BestLAN wireless LAN card.
Specs are: 902-928 MHz spread-spectrum, Po= 250mW, 2 megabits/sec
on your choice of an ISA or MC bus card. Claims to work up to 800ft
with supplied omni antenna (assuming no obstructions and no interference,
presumably) or up to 5 miles with a directional gain antenna.
Comes with a Novell NDIS driver. Retail price from Black Box is $799/each.
I know about the theory of operation, etc. Here's the questions:

  + Is there a Packet Driver available for this card?

  + Has anyone actually tried this card? What sort of real-world throughput
     can be expected?

  + Is this card available from anywhere else, cheaper?

  + Are there any competitive products I should consider?

intended application is LOW COST (under $1000), short-range (0.5 - 3.0 miles)
outdoor point-to-point links in a relatively low ambient RF environment,
to provide TCP/IP connectivity between various open-access machines in our
community.
(to provide higer speed and lower monthly cost than 14.4kbps dialup SLIP
connections for those links that would be short enough to apply this solution)

post or mail replies (followup to comp.dcom.lans.misc)

I have uploaded the "AX.25 Amateur Packet-Radio Link-Layer Protocol,
Version 2.0 October 1984" specification as ax25.doc in /hamradio/packet/
on ucsd.edu . If you have problems getting the file, I'll be pleased to
email it to you.

Maybe for PC-compatibles, use code from Poor Man's Packet:
    I.   Page 8 August 1991 73 magazine.
    II. Anonymous FTP: helios.tn.cornell.edu (128.84.241.2),
           /pub/PMP/pmp11dsk.zip .

(If you have Internet mail but not FTP, try the FTP mail server: send a
mail message with the subject "help" and a single message line "help" to
ftpmail@decwrl.dec.com)

I also offer to email any combination of the following files:

  42024 bytes, Dec 8 13:06, faq_ham9212 = rec.radio.amateur.misc FAQ
  14055 bytes, Jan 4 21:46, faq_packet   = rec.radio.amateur.packet FAQ
  11433 bytes, Aug 11 17:37, packet.tut   = A "packet tutorial"

Just email me.

get a hold of the source code to Andy Payne's (n8kei) Poor Man's Packet
software tnc. it is very well written and the AX.25 stuff (both level 1
and level 2?) is well modularized and separated out.
The code is available on the network (try "archie -c pmpsrc").
(and it is restricted for use in non-commercial, amateur radio applications)

I'm trying to get a copy of MSYS, a BBS and TCP/IP node software package.
I have it on good authority that it's freeware or shareware, and that a copy
resides on the Cleveland Hamnet phone BBS. Unfortunately, I have always
gotten busy signals at both phone numbers I was given for that BBS.
Can anyone tell me from where I might be able to FTP a copy of this software?

Thanks in advance..

Yes the mod affects the HF Packet. It is a tightning of the low-pass filter of
the PK232 to optimize for AMTOR. It also of course then helps for RTTY and for
CW but at the loss of PACKET on HF. It doesn't affect the VHF performance of
the PK232.

You could use different values and optimize for RTTY. Perhaps someone can
think of a way to switch it (the mod) in and out. A easier way to change the
PK232 performance is to outboard a "old" TU (terminal unit) and just use the
Aux modem port and add a front panel switch. This is what we have done with a
number of them here in the Northwest. We found a bunch of old dovetron's for
$50 each pulled from some government service. And use them doing regeneration
on RTTY.

Is anyone out there using the ICOM IC-37A or the Clegg FM-21 at 9600 baud?

I'm helping a friend get these rigs working at 9600 baud and it isn't going a smoothly as I had hoped. I think we have the Clegg working at least we have a good eye pattern on the service monitor.

The ICOM is another story. The most convinent place to inject the TX audio was at pin 7 of IC7 which resulted in a garbage eye pattern. I wanted to inject it at the junction of R98 and C118 but that point is almost impossible to get to.

The service monitor belongs to a third gentleman and we don't want to wear out our welcome so any information anyone has that might help would be appreciated. I would also be interested in hearing about any experiences with either of these rigs at 9600 baud, positive or negative.

I will post the results of our effort here for all to enjoy.....

I can be reached at:
jkesling@cup.portal.com
jkesling@utcam.cse.utoledo.edu

or packet at:
wa8zgo@n8kyd.oh.usa.na

  In France some people developped a protocol similar to "rose" and claim that it is a very good one. Does anyone use this protocol in the US ? Your opinion ?

  I am also looking for the specifications of this protocol for packet radio.

  Please use my E-MAIL address for your answers.

I don't know, if it's possible, but it's illegal in Germany, because the BBS (or Digipeaters) are forwarding messages of non-Hams, and only the contact between licensed people is allowed !
I believe that there are not gateways between PR and Intrenet in Germany - I've heard that's not forbidden concretely, but not legal either - the next on is (was ?) in HB9

Get the 9600 baud modem. With the launch of kitsat, there is a tremendous
amount of link time available and the modem can be used terrestrially as well.

Get the 9600 baud FSK modem. With the launch of KITSAT it doesn't
really make sense for the reasonably well equipped satellite user to
try and send and receive mail with the 1200 bps satellites. There are
only 2 of them for use as a store and forward satellite as well. The

9600's are in wide use around here terrestrially.

I just last night recieved the 3.6 PROM upgrade for my MFJ-1278, which previously had 5-year-old PROMs in it (version 1.1). The new PROMs came with only an incremental manual from version 3.3.

Anyway, I want to bring up NOS. I've managed to put the 1278 in KISS mode, but when I put trace on in NOS, it displays everything as AX25, mostly with "bad header". When I try to initiate a connection in ax25, it clearly sends a connection packet which is responded to by the other side, but the reply is junked by NOS.

I assume I don't have all the parameters set up correctly. Could someone please send me the configuration necessary for getting KISS set up on the 1278 for NOS?

Well... That's depending on what you want to do... If you want to run simple
AX25 packet and noting else any terminal program will work just fine.
There's also a nice program called AmiPac wich i reccomend.
If you want do do something more advanced like TCP/IP you must use
AmigaNOS.
Hardware? The Amiga DOES have a standrad RS232C serial port...
Wich means that you can use any TNC that's not a plug-in card for
a PC-clone.

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
    a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
    No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
    packet radio: WB7TPY@WB7TPY.AZ.USA.NA   -or-
    Internet   : david@stat.com   -or-
    Fidonet   : David Dodell @ 1:114/15

(5) Have fun. Use the gateway as much as you like. That is what it is
    there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, preceded with the
word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address,
proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

Internet: david@stat.com

Internet: david@stat.com FAX: +1 (602) 451-1165
Bitnet: ATW1H@ASUACAD FidoNet=> 1:114/15
Amateur Packet ax25: wb7tpy@wb7tpy.az.usa.na

A friend has asked me to forward the following 2 items to the list.

1. For information on the new amateur radio novice licence
   call 071 215 2072 (24hrs answerphone, UK number) and ask for the
   novice licence information sheet

2. With the new novice licence you CAN get on to packet radio

Thanks

JJ

I have just gotten on the air with a Poor Man's Packet TNC and a Kenwood th27a HT.
The software version of PMP that I have is v1.1   Is there a newer version out
there? Has anyone modified the code and/or the circuit? If so, I'd like to hear
from you.

Yesterday I've Uploaded last version of TST (1.33) at UCSD.EDU in directory
/HAMRADIO/PACKET/TCPIP/INCOMING.

Tst is a pretty Packet-Terminal Program. It's very small (110K in memory),
it works fine with Windows or DeskView(/X). It has Yapp/C, capture in ascii
and binary, buffer, macros, matrix and MD2 passwords. The documentation
is in Italian-language but the program is very very easy to configure.

You might already know this, but the easiest way to find out about
(packet) TCP/IP software is to join the Linux mailing list. A (empty)
message to linux-activists-request@niksula.hut.fi will get you
information on how to join.

Keywords: TCPIP NOS JNOS PACKET
Lines: 78

I have 2 JNOS questions that maybe someone could help me with. First, is there a way for an ax25 station to connect through my JNOS station, through my second TNC to another station in one command? I am running both 2 meters (VHF) and 9600 (450) and want to come up with an easy gateway setup using JNOS. I played with it a little but did not have any luck. I want to operate as a gateway between the 9600 and 2 meters.

Second question. I want to set up my netrom so it listens to and gets the routing information from the neighbour netroms but I don't want me to show up in their nodes list. Below, shows how I set up my netrom stuff and also a trace of JNOS just after starting it. The trace shows the netrom transmissions which I am assuming are what I need to stop.

I set my quality to 40 in hopes that I will not show up in the nodes and routes list. But I am there. If I do a "routes" while connected to a neighbour node, it comes back with.

```
  0 EAGLE 192 1
```

I want to hear, but not be heard. Any ideas??

Thanks!

A friend of mine is looking for a "128K by 8" Static RAM chip for his newly
aquired TNC. He has had no luck locally in finding one. Any info regarding
possible sources for this part would be appreciated.

You may reply to this list, or to me directly at kendallg@vtvm1.cc.vt.edu .

Thanks.

If you are operating the latest high data rate packet mode I
would like to hear from you.
Does it work as well as expected?
What are your comments?
Which machine do you recomend?

I do not have any but suddenly there is an urgent need for
a HF PACKET link and this new mode may just do the job.
You may reply to aa367@freenet.carleton.ca
When the old mode would not..
Any information appreciated

  Currently this country has very little outside communication
and almost nil via packet. If you would like to help in the way
of equipment I can get this equipment to Cuba quickly at no cost.
Personally I would like to see a reliable dedicated system in
Havana to start with and take it from there. This will also
give hams on internet the chance to email all the way.
Any thoughts comments ect will be appreciated.

-=-=-=

The talk has been leaning toward running ax.25 at 9600 baud on 70cm. Seems to me that I've read on this newsgroup that in other parts of the country people are upgrading thier 9600 baud backbones with 56k or 112k baud systems.

A small minority of users here (myself included) feel that the backbone should be faster than 9600 baud. Maybe 56k or 110-112k full-duplex in one of the microwave bands, 33cm, 23cm or 13cm, with slower 9600 or even 1200 baud gateways with routers along the path, in each of the major metropolitan areas.

We'll have to buy or build most of the equipment anyway, so it makes no sense to me to put up a system that will be overloaded in a few months.

If you have any experience with the backbone in your area, or if you have any input at all please respond. I'd like to know what you are doing.

If you were "Master of the Universe" and had unlimited money, and access to all the best mountain peaks in Utah, how would you do it?

I'd be interested in hearing advice, experiences, and ideas on this, too, as
I'm contemplating setting up some sort of high speed UHF router/gateway
service to link "local" backbones in central and northern New England. I don't
live on a mountain, but on top of a 1000' hill with pretty good views.

Greetings,

I would like to talk to anyone that has had any experience converting

(or failing to convert) a Motorola MOCOM 70 UHF transceiver for packet radio use. I am particularly interested in any 9600 baud experience.

Any constructive comments greatly appreciated.

X-Disclaimer: "Me, speak for us?"
X-Witty-Saying: "Mobius strip - see other side for instructions"

If your MOCOM 70's are like ours, well, good luck...

They're as dirty as hell, due to the varactor tripler (AFTER the 2m PA).
Most models cannot be brought down to the 430-440 band (for Australia).

The only useful part on them is the nice 2m PA...

[I understand that _some_ models can be converted; I don't know which.]

Hi. Does anyone have any experience in connecting an Alinco DJ-580t to a
tnc? I have both an AEA PK-88 and a Ramsey packet modem. Is it similar to
the diagrams I have seen for ICOM and other HT's? I'd like to know what
works before I try it. All information will be appreciated. Thanks, Mark

Would someone care to elaborate the 112Kbps system.
Is it done using the DSY modem?
Would it be possible to the get the mods of
the DSY to run at 112Kbps (if at all possible).
Would PI-card handle the 112Kbps speed?
Thank you.

My copy of "NOSintro - TCP/IP over Packet Radio, an introduction to the
KA9Q Network Operating System" by Ian Wade G3NRW just arrived.

It's 350+ pages, and appears to be quite thorough. The few chapters
I've had time to browse are rather readable, with good illustrations
and plenty of examples.

This might be the book that finally gets packet people off their
net/rom duffs and into real ham radio networking!

Well done, Ian!

ISBN 1-897649-00-2. Dowermain Ltd, publishers. Dunno the price.

Is this legal? I know there is an embargo with Cuba, and am unsure
regarding even communications with hams there.

Perhaps, over the years, this has changed. I am sure you have the best of
intentions, humanitarian aid and all that good stuff.

The network in Utah actually works pretty well when noone is on it.

Starting from Los Angeles, one can easily connect to High Potosi Pk.
near Las Vegas, then over to Cedar City , nodes MLF, and SNOW, and then
out into idaho. Alternatively, going out towards colorado or new mexico
also seems workable with the current networks.

If you are out in the sticks and getting frequencies is not a problem,
I would definitely recommend separate user access and trunking frequencies.

"trunking" or node to node communications would optimally be full duplex
and set up so that each pair of sites is on a separate radio frequency,
the higher the baud rate the better.

A BIG mistake I saw in the southeast united states was that everyone put their
packet node on the same channel. Thus while there were a line of hilltops from
southern indiana to georgia, service was unreliable because of all the
collisions.

If you minimize collisions you will have a really good system. This can be
done on the user channels by using a regular repeater (possibly adding the
TAPR bit regenerator to optimize it for data). By using a true "voice-style"
repeater everyone can hear everyone else, and there should never be collisions.
If you plan the node-to-node trunking appropriately, you should have little
trouble with collisions.

Good Luck de Paul KI6CQ

Yes, V1.1 is the latest (see below).

I have modified the code for a softkey to allow listening to _all_
packets while I am connected (to see why my efficiency has dropped to
nil, etc.). Beware, modifying the source code requires an editor that
can handle all 256 characters; I used Microsoft's "m" editor that came
with their C compiler (\msoft\bin\m).

----> I too, would like to hear from others who have modified the PMP
      code.

To answer some common questions, below is the email I got from the

>1. My source for the modem chip and crystal has no more.
>   ---------> Do you still offer the TCM3105 modem IC and crystal for
> $24 ? (details?)

Yes, we do (for $20, not $24).

>   ---------> What other sources do you suggest?

I've heard through the grapevine that EasyTech carries the TCM3105 (look for
their ad in Popular Electronics, Radio Electronics, etc). I've not
confirmed this fact, though.

>   ---------> What alternate modem chips do you suggest? (other than
>   the AMD 7910 and EXAR 2211/2206 mentioned in the article)

About the only alternative I can think of is maybe using a DSP chip. Any chip that supports the Bell 202 modem standard should work.

>2. ---------> Do you still offer the PMP PC board for $7 ?
>   ---------> Is that the big (with watchdog timer) or small
>   (without) PC board version for $7 ?

Yes, yes.

>3. I have PMP software Version 1.1 (July 1991) (executable and source
>   .ZIP files) and the August 1991 "73 Amateur Radio Today" article.
>   ---------> Do I have all and the latest available? (Where?, when?,
>   what?, how to get/ftp?, etc.)

Yep, you have the latest. I've pretty much stopped development on PMP, and have no plans for future versions.

>4. ---------> Are there any email/mail lists to share PMP development ideas?

Not that I know of. The next best thing is to read 'rec.radio.amateur.packet' on Netnews.

-andy

July, 1992

Hello,

Thank you for your interest in Poor Man's Packet (PMP)! We've enclosed a couple of pages of information that should help you get started.

The Disk

The PMP disk contains a PMP11.ZIP archive with the following files:

READFIRST.ME	This file
PMP.EXE	PMP executable, version 1.1
DEMO.CFG	Demonstration configuration file
PMPTEST.EXE	PMP test and alignment program
PMP.DOC	PMP documentation
PMP3.73	Unedited, original 73 article text
ERRATA.DOC	Corrections for article reprints
ASSY.DOC	Modem assembly notes
INTERFAC.DOC	Information on connections to radios
PMPSRC11.ZIP	PMP source archive (Turbo C)
MAKECFG.EXE	PMP configuration generator
MAKECFG.PAS	Source for MAKECFG.EXE (Turbo Pascal)
PMP10.ZIP	Old version 1.0 executables

The unarchiver program, PKUNZIP.EXE is included on the disk for your convenience. Some .doc files may have been added since this printing_please read everything before heating up the iron.

Frequently Asked Questions

How do I hook up my Hayes 1200 baud modem?

PMP will not work with regular telephone modems (these modems do not implement the Bell 202 protocol used for 1200 baud VHF packet). PMP requires a special modem, interfaced to the parallel port. For details on constructing a modem, see our article in the August, 1991 issue of 73 Amateur Radio Today.

Can I get a version of PMP for my XYZPDQ computer?

PMP is for IBM PC and compatibles (running MS-DOS) only! PMP does not run on any other type of computer, including: Atari, Amiga, Color Computer, and Macintosh.

How do I get PMP to work with my Etherbender 1000 VHF rig?

Since there are so many different types of radios out there, we can't provide connection details for all of them. The PMP modem uses the same radio connections (receive audio, transmit audio, push-to-talk) as a regular TNC. Look in your owner's manual for connection details or find someone who has hooked up a similar rig. The disk file INTERFAC.DOC contains some hints and troubleshooting techniques. If you are still stuck, send us a note describing your problem and we'll do what we can to help.

Will PMP work for 300 baud HF packet?

No, PMP only implements 1200 baud packet (for UHF/VHF bands and parts of 10 meters).

Documentation

All of the PMP program documentation is supplied on the disk in the file PMP.DOC. Our article, "Poor Man's Packet" in the August, 1991 issue of 73 Amateur Radio Today has detailed information on building and interfacing a modem (a copy is included with complete kit orders).

The PMP modem isn't hard to build and get running, but we do assume some kit building experience. If you are running into problems, first ask around locally for someone who can help you.

Please do not send us PMP modems for troubleshooting and repair_we can't return them.

How to get in touch with us

We are eager to answer your questions and help you get started with PMP. After all, our motivation for writing PMP was to offer a cheap and easy way to help others get started in packet.

The best way to get in touch with us is Internet electronic mail. Andy N8KEI can be reached at payne@crl.dec.com (please note new address!). You can send and receive Internet e-mail through CompuServe and MCImail

(ask a local guru for help).

Finally, there's always the postal service. Please enclose a SASE with your inquiry. Andy's address is:

Andrew C. Payne, N8KEI
P.O. Box 109
Lincoln, MA 01773

Kit and disk orders should be directed to Andy's address; Kevin is no longer handling PMP orders. Please don't telephone us. We aren't prepared to handle phone calls regarding PMP.

Modem Parts Kits

We have circuit boards (from the 73 article), TCM3105 chip and crystal sets, and full kits. Here's our current price list:

Printed circuit board	$7
(PLEASE SPECIFY LAPTOP OR HOME STATION VERSION)	
TCM3105 and crystal	$20
Miscellaneous parts (no enclosure)	$10
(the above items make a complete modem kit, no enclosure)	
Software disk (with hardware purchase)	$5
(PLEASE SPECIFY DISK SIZE: 5.25" 360K or 3.5" 720K)	

PLEASE, PLEASE specify which version of the kit you want: `LAP-TOP' or `HOME STATION'. Either version will work, but they have different features. The laptop version is smaller, has fewer components, lower current drain, and is recommended for portable operation. The home station version has LEDs, a watchdog timer (so your transmitter won't inadvertently key), and is recommended for non-portable operation. If you don't specify which version you want, we'll send what's available.

Please allow 2 to 4 weeks for delivery. We usually do a lot better than that, but the large response has run us out of parts a couple of times already, (particularly the PC boards) and some can take a while to get.

Please make your check or money order (payable to Andrew Payne) in US funds drawn on a US bank. Many Canadian checks or money orders are in US funds, but need to clear through a Canadian bank (which costs a $5-10 service charge plus the delay).

Finally, if you are not in the US, please include any special customs declarations that we should put on the package.

Obtaining the PMP software

If you've got a friend that is interested in PMP, feel free to make a copy of the software. PMP is freely copyable for NON-COMMERCIAL AMATEUR RADIO USE ONLY. If you would like to send money, we suggest a $10 donation. Remember that PMP is not public domain (Andy retains the copyright) and so may not be sold for anything beyond reasonable duplication costs.

For the latest version of the PMP software, please send $10 ($5 with

a hardware order, see above) for a disk. Please specify the format: 5.25" DS/DD or 3.5" DS/DD disk.

Also, the latest version of PMP can be found via Internet anonymous FTP on helios.tn.cornell.edu (128.84.241.2) in the directory /pub. If you don't have Internet mail but not FTP, try the FTP mail server: send a mail message with the subject "help" and a single message line "help" to ftpmail@decwrl.dec.com. PMP can also be downloaded from CompuServe, GEnie, or the 73 Magazine BBS at (603) 525-4438.

At present, we can't register users for automatic updates. (the current version is 1.1)

We hope you enjoy PMP!

Andy, N8KEI
Kevin, WB2EMS

Well, if I have understood correct this G3NRW is the one who has made NosView on-line help package for NOS. Every now and then I have seen him announcing a new version of it on packet. He has told that he will copy it to anyone sending a HD-disk and a SASE to him.

Does anybody know if it is somewhere ftp-able? And where? Or if somebody has it, could he/she upload it to some anonymous-ftp server

and inform the rest of us of it?

     First let me thank the dozen or so people who responded to my general questions about packet radio. (There were too many to respond to personally with two mid-terms this week :-) I have also found out all about the Dartmouth Amateur Radio Association and their PBBS, and I will hopefully get licensed in the next month or so.
     I have a question, however. I have bought the book _Your Packet Companion_ by Steve Ford WB8IMY. On page 1-11, there is a picture of a packet station built into a watertight camera case using one of those ancient Radio Shack "portable" computers with an 8x40 display. I have recently read in some of my computer magazines about how some companies are now coming out with PCMCIA card modems (PCMCIA cards are those are the little credit card size things) to be used with palmtops like the Sharp Wizard and the HP 95LX. Now, I am wondering if anyone knows of any existing or planned PCMCIA card TNC's? Then, all you would need was a little hand-held radio, a Sharp Wizard, and the TNC card to have packet radio anywhere! Am I right? Does this sound feasible?

I have been running versions of NOS in the past and have a couple
of questions:

First: What is the latest and greatest version of NOS available now
(I have been running G1EMM) and where is it available.

Second: What is available in the way of very fast radio modems

for packet?

Thanks;

Paul Israelsen

I am interested in talking to users of the above equipment that use it on the
20m band. Also anyone else who has used it for or on remote control operator
which as I understand the FCC rules is legit, since only a few have the FCC STA
for automatic operation. My desire is to interface the PC to change frequencies
and change other parameters to stay locked in to or connected to others in the
main 20 m frequencies. At present I am reading the documenation manuals for the
TNC and the Transceiver and experimenting manually, I believe the TNC has a
technical manual which I should get..Does anyone know if AEA is on packet or
what would someone packet address will be at AEA? Maybe the internet or packet
address of the author of the software which come with the PK232MBX (Ed L...) do
no remember his name. If anyone has done this allready on HF please contact me/

I plan to use some of the PK monitor command to determine if I am on frequency
and change it accordingly, along with other tranceiver or TNC coomads. Like I said
I am still experimenting manually with limited sucess maybe due to unfamiliarity
with the software package or equipment.

The call sign being used is the club station W8BI.

I acan be reached via internet email or packet at either

N8WPB@W8BI.#day.oh.usa.na or n8wpb@n8acv.#day.oh.usa.na

I was looking through the catalogs, and was wondering what is the best modem / or satellite mode to use. The price of the G3RUH 9600 baud modems that I have found were HALF the price of the 1200 baud pacsat modems! I think that there are two satellites that use the 9600 buad modems, and a lot more that use the 1200 baud ones. Which would be better to start off with?

I do like the idea of going to 9600 baud on terrestial links, but I need someone else to talk to, first! I could justify the cost if I could use them on a satellite also. I realise that with the 9600 baud modems, I will have to get another radio to modify for direct FM, while with the 1200 baud modems, I could use the existing all mode radio. Any suggestions?

Thanks
alan

Last I heard, there are currently no "banned" countries (for US
amateurs). Third party traffic with Cuba is another matter - I
don't have the list where I am now, so I don't know if that is
legal, but I'd doubt it.

From: J.R.Jagger@sheffield-hallam.ac.UK

Newsgroups: rec.radio.amateur.packet
Subject: latest version of NOS ?
Date: 12 Feb 93 17:28:31 GMT
Organization: Sheffield Hallam University
Lines: 50
Message-ID: <MAILQUEUE-101.930212172831.480@oak.shu.ac.uk>
Reply-To: J.R.Jagger@sheffield-hallam.ac.uk
NNTP-Posting-Host: ucsd.edu
Originator: daemon@ucsd.edu

Could someone please give me the location of the latest copy
of NOS + source that is ftp'able.

I have some source labelled nos1229.zip but I have a feeling
that it's not the most recent release.

Also does this latest copy have the facility for encrypting
the packets? I.e., an encryption scheme where the administrator
of the packet <-> internet gateway can set and change the
encryption key at will. Preferably by changing the contents of
a file (or similar) and not having to recompile some altered
source code (but if the later is all there is that'll do.)

The encrption does not have to part of NOS, it could be a separate
package that someone has put together that you need to link in.
I realise that you can't transmit messages in code across the
ether. I need the encryption *only* for the internet addresses on
the header. I need to ensure that someone really is who (s)he claims
to be.

What I plan to do is start a gateway here a Sheffield Hallam
University. It would operate two ports.

Port 1. 1200 baud. Access to the BBS and mirror of ucsd (say)
(both on the gateway itself) but NOT access to the internet via the
gateway. In other words, not a gateway for this port. Available to all
amateurs.

Port 2. 9600 baud 1/2 duplex. Only for Sheffield Hallam Uni staff
who have passed their amateur exam. Full access to the gateway.
Gives staff ability to telnet to machine at work, and access all
facilities that that machine has. I.e., ftp and telnet to internet.
However, to do this we must have a way of ensuring that the user
on this port is who (s)he says (s)he is. Hence the encryption.

Finally this is all just in the planning stage. A major spanner in
the works could be that work is right in the centre of Sheffield
which is right at the bottom of seven all-encompasing surrounding
hills, and many staff live over the other side of a hill.

Please help.
Thanks
JJ

P.S. Has anyone ported NOS to C++ ?

Chuck:
If your NOS is compiled with NNTP server built-in
you should be able to do it easily by turn on
the:
     nntp ihave 1

In fact a couple of us have been doing NNTP forwarding
between NOS NNTP servers in AMPRNet for a couple of months now.

Unfortunately, the off-the-shelf NOS.EXE (from ucsd.edu)
doesn't come with NNTP server built-in -
Some have NNTP client built-in but not NNTP server
so you have to compile it yourself.

I have been using fsuu12r4.zip as newsreader
for my NOS NNTP server for quite awhile.
It works fine for reading the news (in fact,
it is quite similar to Rn in UNIX).

Unfortunately, to follow-up, reply and post an article
it doesn't modify the /spool/news/history +
some other incompatibilities in the directories.
Well, actually it works - but I have to manually
edit the /spool/news/history by hand :-(....

Would appreciate any info on a decent newsreader
fully compatible with NOS NNTP server
(hopefully with source code :-) .....

Thank you.

I'm just starting to study for my license. (The local club just started a class.) I was wondering about the price of packet modems and which speeds I should look into getting?

As an example of the type of reply that I'm looking for, here's an example for (telephone) modems:

> Almost all modems will automatically connect at the highest common speed. 300 and 1200 bps modems are effectively obsolete. 2400 bps is the lowest speed that you should even consider getting, but many BBS's still have only this speed. 9600 bps (v.32) is common for new purchases, but for a little bit ($50-$100) more, you can have 14400 bps (v.32bis). The 28800 bps (nicknames v.fast/v.last) is comming out "real soon now", but since many computers can't keep up, it may be better to stay with v.32bis.
>
> Another feature that you should look for is built-in error correction and data compression. v.42bis compression can get (theoretically) up to a 4:1 compression ratio making a 14400 bps modem effectively a 57600 bps modem. However, the peak expected compression is about 2:1.
>
> However, beware of the cheap modems. A <Brand-S> v.32bis modem will cost you about half of a <Brand-PP> v.32bis modem, but the <Brand-S> is severely buggy and should not be used for BBS's or any autoanswer application. I bought the <Brand-PP> for $389 (mail order) because of the better quality.

I know that locally, they are running 1200 bps and 2400 bps packet radio. However, a friend and I are close enough to directly connect and would like to get as fast of a modem as possible for a reasonable price.

As a packet protocol, EC (error correction) is inherent in the protocol, correct? Would a TNC with builtin DC (data compression) (effectively) be ruled out because of the FCC restriction on "clear text" transmission? Or, would it be ruled out because of the need of the remote modem to maintain an updated compression table which isn't feasible?

Thanks in advance,
-=:[VAL]:=-

I don't know much about the feasibility of producing a PCMCIA TNC, but
there are a lot of people doing it with a pocket tiny-tnc type of set
up.

I think an hp95-lx or some other palmtop which is more like a true-PC
would be much nicer than a Wizard because of all the ham software
available for the DOS platform. The hp95-lx has a serial port, but I
don't think it has a slot... at least not the "type 2" slots which the
modems are being made for. Type 1 is just for memory cards (I think!
I'm not positive on the slot-thang).

Yes, this sounds very feasible, but I am afraid that it will be
quite a while before you see this becoming real. Companies that
make these gadgets work on a strict supply and demand basis, and
the Amateur Radio community is still too small for them to bring
out such a specialized electronic gadget before fully exploiting
the normal commercial market. This means that the PCMCIA modems
will have to become common place before they are modified to
produce any other type of modem - such as a TNC.

I have written a utility valled PNEWS which does exactly this: Post
articles to specified NNTP groups. It is based partially on code
developed by EI9GL (Paul Healy) for BMH02 and by Bdale Garbee for
BM.EXE. You should be able to find it on UCSD.EDU.
There is also a new release with some bug fixes, but I cannot ftp
to ucsd.edu anymore. If someone would like to upload it there,
I can send him a floppy disk by mail.

>sound familiar to anyone and if so, where can I pull it off of the Internet?
>

The document entitled "Beginner's Guide to TCP/IP on the Amateur Packet
Radio Network Using the KA9Q Internet Software" is available by
anonymous ftp from ftp.eecs.ucdavis.edu.

Version 2.0 of the guide documents the use of NOS 911229 (PA0GRI v2.0h)
and BM v3.3.2. The document is available in three forms in the
directory pub/ka9q.

"nosbgnlp.zip" unzips to a 66 page ascii "line printer" document,
which can be printed with the UNIX lpr command.

"nosbgnps.zip" unzips to a 54 page PostScript document, which can
be printed on a PostScript printer.

"nosbgnpr.zip" unzips to a 66 page ascii "print" document, which
can be printed using the DOS print command. You will need to send
control codes to your printer to control the page offset and you
should turn perforation skip off.

Comments and suggestions for change to the document are welcome.
I have gotten almost no feedback on this document since I released it
nearly a year ago, so I have concluded that there is little interest
in it. However, I will continue to make it available by ftp.

The subject says it all.. I have finally decided to get a TNC,
and the KPC-3 seems to be the one that is the least expensive
unit with the most features and backing.. The only question is
do the other owners/friends of owners feel the same way that I
do? Is it a worthwhile unit to purchase?

Talk to your local cellular service providers. They use broad band amps to
amplify the combined cell site transmitters. They arent cheap...and the
filtering to keep your emmisions in the band is also expensive. You never
know they might be willing to loan you something for experimental purposes.

I find it hard to believe that "every site has a bum version", so you're
probably using an older version of PKUNZIP than was used to ZIP the file.
Get a copy of PKUNZIP 2.04e if you can, (or 2.04c if you can't).

Andy

Hello Angelo...

>> I am using the MFj-1270B with the MFJ G3RUH modem with my Alinco 1200 data
>>radio to connect to a Cluster high speed backbone network.. It works great
>>for me.. I am wondering the mod that Alinco suggested to you?? There were
>>several of them.

The Mod was as follows:

TRANSMITTER

1. Remove R-31
2. Remove C-40 (save this part, it is to be reused!)
3. Connect one leg of C-40 to PIN 7 of the VCO Board
4. Connect a jumper from the free leg of C-40 to the HOT end of C-35
              The MIC input is now connected DIRECTLY to the VCO!

RECEIVER

1. Disconnect the PINK wire connected to the MIC connector and the PC Board from the PC Board
2. Reconnect the PINK wire to PIN 2 on the IF Board connector
   This eliminates the low pass filtering on the discriminator!

I am real happy to hear that at least one mfj & alinco works.. Is this the mod you used???

Thanks Bob Ross n2oml

I was given a Data General Computer by a local ham. the computer has at least 4 serial ports, and I would like to use it exclusively for packet (either ax.25 or tcpip).

It uses an operating system called AOS. I have been trying to get some type of Document or handbook on it, but with no success. It was used to monitor readings from medical tests, before the readings reached the mainframe.

Is anyone familiar with this? Leave me a message and if necessary I can give yo u a land like so I can get enough information to decide weither using it for pa cket is feasable.

I just purchased a used Kenwood TR-7730 2m FM rig. I have no
documentation with it. Could someone out there in radion land please help
me with the following (or more):

Power level of this rig?
     There is a low/high switch but I'm not sure if it's refering to
     audio tone or power level.
What are the mic pin outs?
     I want this radio primarily for packet.
How are the PL tones properly used?
     There's a keypad on the back of the mike and there are also two
     buttons on the top of the mic. They are labeled up and down.
     Is this up and down in freq?

I'm not too familiar with currant equipment as I've not been on the air in
8 or 9 years.

Either post or e-mail is OK.

Thanks in advance.

I recently purchased a BayPac Model BP-1 packet modem. The
instructions are very vague on how to make the cables to interface the
modem with my HT. I have tried all of the suggestions for other
models (Kenwood, Yeasu, etc.,...), but nothing works for my HT. I have
a Radio Shack HTX-202. If anyone has any suggestions for this model
HT please e-mail me. Any help will be greatly appreciated.

>the connect request go by in the trace buffer. There has GOT to be a better
>way. Is there some way I can have it tell me that someone is trying to
>connect to me?

Turn jumpstart on... then they will drop into the mailbox (assuming you are
using JNOS or a GRI version).... from which they operator page to open a
session on your screen for keyboard qso.

>
>4) And, if I blow it typing the connect command and end up trying to connect
>to a non-existant node, the disconnect command has no effect (because I am
>not connected?). How do I abort a connect request?
>
use the reset command to abort a session instead of issuing a normal close.

Hello all,
 I noticed in QST that there was going to be a series of articles
in QEX about automatic link establishment, I would like to read
these articles but I have never seen how to subscribe to QEX.
I have been an ARRL member for about a year and the articles
in QEX look very interesting.
 I am also interested in companies that have ALE complient radios
for a job I am doing at work.
 I would appreciate information on how to subscribe to QEX and
any articles on commercial/amateur HF store and forward systems.

I am looking towards using ALE for link establishment CLOVER
II for data transmission and a sytem similar to the BBs network
for store and forward possibly X400 based.

Greetings,

A while back I had a KISS only ROM image for use with a TNC-2 clone. I
didn't need it at the time and like all things unused, I lost it. As I
recall it was bundeled into one of the many TCP/IP available TCCP/IP
kits.

Can anyone tell me where I can find a KISS ROM image?

Thanks in advance.......

To the fellow ham who posted questions about the KPC3:
I think its a great basement priced true tnc. It is a small full functioning tnc that has all of the Bells and Whistles of others. It has the neat "newuser" mode on it that will allow you to work your way through the commands until you get them all down pat. It does become a little tiring after a while because each time you put it in and take it out of kiss mode it reverts to this newuser mode, and it causes a minor pain to reset each time till you remember to switch it back before you start playin'.
Aside from that its great. Supports KISS, WEFAX and regular VHF packet. Small lightweight, heavyduty const, and low pwr loss contribute to great portability.
Hope this helps!
BTW: The LED's can be turned off when the tnc is left on, which is great if you like your room pitch black at nightime, not to mention pwr conserve when you run it off of a 9V battery!

I know absolutely nothing about packet radio - I suppose I'd better read the faq. Anyway... Does anyone know if it's possible to send/receive packets with a mac?

Any advice appreciated.

I have used AmiPac. I think it is best which I have seen. You have
to own TNC like PK232, PK88, TNC2 or clone etc.
AmiPac is shareware program. It should find everywhere..

I am looking for a way of connecting two machines via radio. Any help
would be appreciated. I have looked in the FAQ's but there doesn't
seem to be any info. relevant to my specific problem. Here are the
details:-

The objective is to be running as fast a link as possible, preferably
using tcp/ip over AX.25. The hardware at one end is a Sun IPX and an
Amiga at the other end, (hopefully to be complemented with a Sun at
some stage). The physical distance between the machines is about a
mile with a near line of sight between them. Connection with other
packet radio users is not required.

Would using a pair of GRAPES modems coupled with directional (Yagi?)
aerials be suitable? Or is there a better way of doing this? What
frequency/frequencies should I use? I presume I would need a HAM radio
license, and does anyone know how to obtain one in the U.K.

Thanks,

Andy.

Can some one help me out I heard about a kit that you can buy for $30 or $
40 dollars for packet radio could someone help me out.I believe a club from
L iverpool had these and they assembled them in the Library at Cabramatta if
that makes anyone remember. They told everyone about it on the WIA
broadcast.

Seems like there are lots of requests for info about ham radio software for

the Mac... so....

Quite awhile back... a couple of people starting putting a list of Mac ham radio software together. Below is what that list plus a few more items. I would be more than happy to accept any updates to this list of Mac software. If you have any suggestions about the list, additional pieces that you know of or anything related to ham radio software for the Mac... I'd really like to hear from you.
(See below)

==========
Macintosh Amateur Radio Software - January 1993

The information in this list was gleaned mostly from flyers supplied by the software vendors, or in some cases from reviews in amateur radio publications. Some of the information has not been verified for a long time; please check with the vendors for the latest product specs, pricing, etc.

Collections
MacNet
Public-domain programs (currently on 12 disks) contributed by Macintosh packet users. Includes test preparation, contest logging, propagation prediction, satellite tracking, and amateur television. Send formatted 800K Macintosh disks with stamped, self-addressed disk mailer to John D. Seney, WD1V, 144 Pepperidge Dr., Manchester, NH 03103. Contributions of public-domain programs are encouraged.

"Project Mac"
Contest logging, antenna design, satellite tracking, clip art, etc. Microsoft BASIC required for many of the programs. Most of this software is now available in the MacNet collection. Send three formatted 800K Macintosh disks with stamped, self-addressed disk mailer to Stan Horzepa, WA1LOU, 75 Kreger Drive, Wolcott, CT 06716.
(Compuserve: 70645,247)

"Amateur Radio Software for Macintosh"
Extensive catalog including logging, Morse code, gray line, test preparation, satellite tracking, contesting, and packet radio programs. ZCo Corporation, P.O. Box 3720, Nashua, NH 03061.

Amateur Radio #1
Contains satellite tracking, Morse code, attenuator design, and Ohm's law calculator programs. Kinetic Designs, P.O. Box 1646, Orange Park, FL 32067.

Test preparation
Ham Stacks
HyperCard stacks containing the entire question pool for each license class. Can be used for preparation or generating actual tests.
  Send two formatted 800K Macintosh disks with stamped, self-addressed

disk mailer to Diana Syriac, KC1SP, 49A Meadow Pond Drive, Leominster, MA 01453. (Internet: dls@genrad.com) Also available via anonymous FTP from various sites, including uxc.cso.uiuc.edu (/pub/ham-radio).

MacHam
Test generators and study aids for the Technician, General, Advanced, and Extra class written elements. Includes the complete question pool for each license. Coyne Co., P.O. Box 2000-200, Mission Viejo, CA 92692.

Morse code practice
N6MZV Morse Trainer
Lets you practice any combination of letters, numbers, and/or punctuation characters. Can send user-created text files. RT Martin, N6MZV, 10382 Orange Avenue, Cupertino, CA 95014. Also available via anonymous FTP from ftp.apple.com (/pub/ham-radio). Shareware.

Morse Tutor
Sends random groups of letters, numbers, and/or punctuation characters. Send formatted 800K Macintosh disk with stamped, self-addressed return disk mailer to Jack Brindle, WA4FIB, 726-175th Street SW, Bothell, WA 98012 (Compuserve: 73365,606). Also available via anonymous FTP from ftp.apple.com (/pub/ham-radio). The program is copyright, but free for noncommercial use.

Morse Mania
Designed for those already familiar with Morse code who want to improve their speed. Allows code practice at various speeds and audio pitches. Can generate random sequences or play the contents of user-created text files. Available via anonymous FTP from whirlwind.stanford.edu (/pub/binary). Contact Edward Plumer, KM6IQ, for more information (Internet: plumer@isl.stanford.edu). Freeware.

MacMorse
Randomly sends chosen characters. Lets you create your own practice files. David A. Kall, 700 Marine Parkway #314, New Port Richey, FL 34652.

Zihua Morse
Designed to teach Morse code to beginners and to improve the accuracy and speed of advanced users. Responses can be typed into the computer; the program will calculate accuracy and timing statistics for each session. Optional speech synthesizer reads the characters out loud for an accuracy check. Zihua, P.O. Box 51601, Pacific Grove, CA 93950.

Packet radio
NET/Mac (KA9Q TCP/IP)
Allows simultaneous TCP/IP, AX.25, and NET/ROM connections. Requires a TNC with KISS mode. Copyright, but free for noncommercial use.
   Send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Doug Thom, N6OYU, 1405 Graywood Drive, San Jose, CA 95129. Also available via anonymous FTP from ftp.apple.com (/pub/ham-radio); and on the Digikron, WB3FFV, and N8EMR dialup BBSs.

Virtuoso
This terminal program works with TNCs to display packet, RTTY, AMTOR, and CW. Features a split screen and a type-ahead buffer. Includes a word search utility, a spelling checker, and a built-in scripting language for automating routine tasks. Shareware.
  Available on America Online, GEnie, and Compuserve. Also available via anonymous FTP from ucsd.edu (/hamradio/packet/misc) and other sites. Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk mailer to James E. Van Peursem, KE0PH, Rural Route #2, Box 23, Orange City, IA 51041. (Internet: jvp@cpre1.ee.iastate.edu)

MacRatt with FAX
Terminal program for use with AEA's PK-232 multimode controller. Supports packet, CW, RTTY, AMTOR, and facsimile. Includes cable. Advanced Electronic Applications, P.O. Box C-2160, Lynnwood, WA 98036.

RTTY
MacTTY
Decodes Baudot or ASCII transmissions. Can also be used for packet radio and other digital modes (including landline data communications). Includes split screen, a 15,000-character type-ahead buffer, and canned messages. Summit Concepts, Suite 102-190, 1840 41st Ave., Capitola, CA 95010.

Logging
Ham Radio Station Logbook
HyperCard stack that stores and displays radio contact information. Automatically stamps entries with time and date. Contacts can be sorted by frequency, call sign, or date of contact. Includes report formats, a "Q-code" reference list, and on-line help. SanSoft, 892 E. Quail Place, Highlands Ranch, CO 80126. (The same program appears to be available from Heizer Software, 1941 Oak Park Blvd., Suite 30, Pleasant Hill, CA 94523.)

FDLog!
Contact logging and duping program. Can transmit any of ten programmable CW messages. Generates real-time statistics on QSO rates. System One Control, 3900 85th Ave N, Suite 200, Brooklyn Park, MN 55443.

LOGic
(Macintosh version scheduled.) Lets you define the rules determining dupes (such as once per band or once per contest). Displays heading, distance, and other information about the country being worked. Automatically enters contact time; if interfaced directly to a radio, also enters the frequency, band, and mode. Shows status toward earning amateur-radio awards. User-definable database fields. Exchanges data with other programs. Personal Database Applications, 2634 Meadow Bend Court, Duluth, GA 30136.

Propagation, gray line, DX headings
DX Map

Displays a map of the world with the terminator. Gives location, prefixes, zone numbers, distance, and heading for any country you select. Freeware. Requires HyperCard 2.0.

Available via anonymous FTP from joker.optics.rochester.edu (in the /ham/dxmap directory). Or send a formatted 800K Macintosh disk with a stamped, self-addressed disk mailer to Len Saaf, NV2Z, 52 Raleigh Street, Rochester, NY 14620 (Internet: saaf@joker.optics.rochester.edu).

SatTrak
Primarily a satellite tracking program, but also calculates beam headings, Maidenhead grid locations, MUF plots, and band openings. Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K or 14.MB Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

Sun Clock
Desk accessory. Displays a color map of the world, including the terminator. Indicates current time for any location. MLT Software, Inc., P.O. Box 368, Portland, OR 97207.

DX Window
Draws a great-circle world map centered on your QTH, with day/night terminator indicated. Displays over 400 DX locations with prefixes and beam headings. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

Skycom 1.1
Enter solar flux and get propagation predictions to desired areas of the world. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

Skycom 1.5
Provides sunlight status at both ends of a path; MUF, F0F2, and FOT frequencies; S/N ratio of the link; and other information. Engineering Systems, Inc., P.O. Box 939, Vienna, VA 22183.

DX Helper
Displays beam heading, distance, gray line, and propagation information. Generates great-circle maps. Identifies prefixes, zones, and oblasts. Includes code practice. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98336.

Satellite tracking
SatTrak
Tracks one satellite across a world map as it moves, displays the instantaneous position of several satellites, or generates tables of all satellites visible from a certain location at a given time. Also calculates beam headings, Maidenhead grid locations, and MUFs.

Shareware. Available via anonymous FTP from sumex-aim.stanford.edu (/info-mac/app). Or send a formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Mike Pflueger, WD8KPZ, 6207 W. Beverly Lane, Glendale, AZ 85306.

MacSat
Tracks up to 21 satellites simultaneously, either in simulation or real-time mode. Text screen displays ground-track coordinates, range, mean anomaly, visibility (azimuth and elevation) and Doppler shift frequency information for all satellites being tracked. Graphical screen portrays the satellite ground tracks superimposed on a world map. Polar plot displays graphically the precise location of each visible satellite above the observer's horizon.

Developed by the Geodetic Research Laboratory of the University of New Brunswick. Available from Richard B. Langley, R.R. 12, Fredericton, N.B. E3B 6H7, Canada.

OrbiTrack
Calculates look angles to selected satellites, plots current satellite positions on a world map, and displays the visible passage of a satellite against background stars (either within the program itself or via a data file that can be read into the Voyager astronomy program). BEK Developers, P.O. Box 47114, St. Petersburg, FL 33743. (Bill Bard, CompuServe: 75366,2557) (Note: This replaces BEK's previous MacSat program, which was not related to the program of the same name from UNB.)

QuikMac
Macintosh version of N4HY's QuikTrak program. Requires Microsoft BASIC. AMSAT, P.O. Box 27, Washington, DC 20044.

Satellite Orbit Prediction Program
Macintosh conversion of W3IWI program. Requires Microsoft BASIC. Send formatted 800K Macintosh disk with stamped, self-addressed disk mailer to Earl Skelton, N3ES, 6311 29th Place NW, Washington, DC 20015. Or send self-addressed stamped envelope for source listing.

Satellite Pro
Uses world maps and tables to indicate rising and setting schedules, current locations, mutual visibility opportunities, and footprints. Includes Mercator, polar, and great-circle displays. Optional antenna control. MacTrak Software, P.O. Box 1590, Port Orchard, WA 98366.

Radio control
ICOM Radio Control
Provides a Macintosh interface for controlling ICOM transceivers that use the CI-V remote-control system. Lets you quickly change frequencies and modes. Also does logging and duping. Requires a CI-V to RS-422 converter (schematic included with program). KE6FG Software, 9763 Pali Avenue, Tujunga, CA 91042.

Ham radio BBSs
Digikron Systems BBS
Various ham-related applications, including logging, propagation, Morse code, and packet. (408) 253-1309.

MacScience BBS

Various ham-related applications, including antenna design,
propagation, WEFAX, packet, and Morse code. (408) 866-4933.

N8EMR BBS
Various ham-related files, including packet, DXing, and contesting
software; AMSAT bulletins; and several ham newsletters. (614) 895-2553.
Also available via FTP on AMPRnet at 44.70.0.1.

WB3FFV BBS
Various ham-related software, including packet, contesting, and Morse
code applications. (410) 661-2475, 661-2598, and 661-2648.

Online Services carrying Ham Radio software
America Online

Mark... your file is ion place on AOL and has about 40 some downloads
already. Thanks for the application... works great.

Sorry I didn't get the info about your program (and ftp site) until after I
put out the info about Mac Amateur Radio Software. I have it included in the
next release of the list!

BTW... for those of you PK232 owners that want to monitor activity on TCP/IP
channels... you are going to have to make sure you allow ALL monitor
conditions (6 on a PK232) and enable the PASSALL ON... otherwise the PK232
```

will not allow TCP/IP's invalid data! PK232 users... the MCOM command is not a valid command but from your packet terminal program... set the other conditions before you start PacketTracker and all should be set. For an idea of what copmmands need to be set... from your terminal program... type DISP M <cr> to see the "Monitor" parameters.

73 for now.... c u on the shortwaves

I have recently acquired an AEA PK-87 TNC. The price was right,
but there were no cables, book, or power supply.
Can anybody help me out with information such as pin-outs,
programming and whatever I need to get this working? I do need
info on level adjustments, and frequency of tones adjustments
and whatever else I have forgotten.

I do operate an MFJ-1270B, and I thought this would be a good
second unit to experiment with.

My Packet address is: WA9JOB @ WA9POV.GRAFTON.WI.USA.NA

>Andy.

 Andy,
     If the UK rules are anything like the ones in the US, your selection of
frequencies and requirements for licensing will depend upon whether this is a
business/work related project or a fun/HAM related one. Here in the states,
any use of the amateur bands for business or work is forbidden. The user would
need to obtain another license (commercial maybe).

     There are a number of "wireless network" links being marketed these
days (They work up in the 800 or 900 MHz region). I'm sure you have already
looked into these and found them to be expensive.

Reply-To: molson@bml4380.cpg.cdc.com (Mark Olson)
Lines: 36

I have a problem with a copy of NOSVW137 I recently installed
and am completely confused as to what might be the problem.
I suspect I have misconfigured the interfaces somehow, but perhaps
someone has had the same problem & can give me a clue as to what
I have done wrong.

The station is a PC connected over COM1 (4800 baud) to a
KISS tnc. The AX25 configuration for this is relatively
straightforward and NOS appears to be working fine.

The problem emerges when I try to create a TCP connection
to other stations, the reply packets are
interpreted as AX25 connection requests
and the remote server gets connected to my AX25 BBS, with
an escalating number of packets being sent from my station.
If I monitor the packets I can see what looks like a relatively
normal AX25 connection, including the menus, but of course
the response to FTP server packets is "HUH?" and a repeat
of the menu -- you get the picture. Needless to say, the
original FTP connection (or other TCP request like FINGER)
never gets completed.

I can run an older copy of KA9Q software without the BBS
functions and the TCP/IP suite appears to work fine. I had
suspected that my copy of NOSVW137 was buggy, but I see
other stations running the same software without problems!
So it HAS to be an error I have made in configuring the
protocol stack, but where?

Thanks in advance...

Hi folks,
Anybody know of a way to persuade WNOS (or anything similiar) to send a
nastygram (i.e. an IP frame with all attributes set, SYN/ACK/FIN/PSH, carrying
one octet of data)?. I'm doing various tests on my system and want to see if it
can handle such protocol abuse!

(The above are also known as Christmas tree or kamikaze packets)

TIA fr advice

I am hoping that someone can tell if there is such a beast as the
above (and if so where I can ftp it from). The O.S's (operating
systems) in question run on a IBM-PC 80386+, and are DOS and Linux (a
Unix clone). The latter may not even be ported yet. I want to convert

the source code to ANSI-C (or possibly C++) and find out how it works.
Thanks for any help

Organization: The Portal System (TM)
Distribution: world
Lines: 17

I told a friend I would help get him going with 9600 baud on 220. I didn't
realize that he didn't have a schematic for the radio he wanted to use.

The radio is a Clegg FM-21, 220 rig. It is crystal controlled and appears
to be true FM, it looks like a varactor modulator in the 20.5 MHZ oscillator.
I think I should be able to inject the transmit audio from the modem here.

As far as receive audio for the modem it looks like I can pick that up at
pin 12 of the CA3075.

I'd be interested in hearing from anyone who is using one of these radios
at 9600 baud and what they had to do to get it to work. I'd also be interest
in hearing from anyone with a schematic that could verify what I said above.

Thanks for your help.

Does anyone out there have any info on the above.
Are there already such gateways anywhere?
Are there any in the UK?
Are they 'legal'?
I ask because I am told there are non in the Sheffield area (UK)
   where I live, and I'd like one.
Is there a reason that there isn't one near me?
If not could I set one up, and if so what would it entail?

You get the idea. Plenty of questions there.
Any and all info gratefully received.

Greetings, all! I'm the person who's maintaining the FAQ for this group, and wanted to ask the net at large (very large) a question: What would _you_ like to see in the next revision of the FAQ?

I've heard several suggestions of lists of places where software can be gotten for various platforms, but I'd prefer to just provide pointers to those lists, if that's possible, to minimize the amount of non-general information in the FAQ.

I have seen the Mac software list, and have asked the author to make it available via FTP, or repost regularly, so that that resource would be available to the 'net.

However, I would also like to see a list of PC programs and places, and maybe also Amigas or Unix systems or TOPS-10 :) systems... you get the idea. Does anyone have (or know of directly) such lists that they think would be interesting to the 'net, or at least some portion of it, if it were to be pointed to on a regular (monthly) basis?

While I'm at it, I'd also like to thank those people who have been submitting changes to the FAQ, and invite anyone who wants to be on the editorial mailing list to send a note saying so to packet-faq-request@wattres.sj.ca.us. N.B.: That address is a human (me, via root's mailbox), and I will get around to it as soon as I can. I will reply to all who I add.

People who are currently on that list are:

steve@wattres.sj.ca.us	Steve Watt KD6GGD	San Jose, CA, USA
ikluft@uts.amdahl.com	Ian Kluft KD6EUI	San Jose, CA, USA
nomad@ecst.csuchico.edu	Mike Larish KD6CTZ	Chico, CA, USA
payne@unomaha.edu	Matt Payne	Omaha, NE, USA
steve@matt.ksu.ksu.edu	Steve Schallehn KB0AGD	Manhattan, KS, USA
pschleck@unomaha.edu	Paul Schleck KD3FU	Omaha, NE, USA

cas30@uts.amdahl.com   Chris Swartout N6WCP   San Jose, CA, USA
winter@apple.com   Patty Winter N6BIS   Sunnyvale, CA, USA

(Yes, folks, I haven't forgot about the list, just soliciting input from
the public.)

If you have any _specific_ editorial-type items, do send those to
packet-faq@wattres.sj.ca.us.

73 to all.

Steve

BR>The first problem is the deviation, the 9600 baud manual quotes that the mod
  >will produce 8 volts of audio. Well all three of the MFJ 9600's I have, sta
  >clipping at less than half a volt!!! That equates to 1.8 kHz of deviation..
  >any more and the waveform distorts seriously as viewed on the scope. (Why i
  >it so different than the manual quotes??)
Bob, where do the doc's tell you to interface to on the Alinco?

The KPC3 is made by Kantronics "RF Data Communications Specialists"
of Lawrence KS. Its a Kantronics Packet Communicator and is priced
about $120.00, available at most of the 1-800 places in all ham magazines!

>can handle such protocol abuse!

>(The above are also known as Christmas tree or kamikaze packets)

I've not tried it .. but the only way that comes to mind is to use the

'comm' command, and construct a frame of your choice manually .. I'm not
sure if the character escape mechanism will extend to the task you would
be asking of it, it is designed to cope only with text .. but it might not
take a great deal to modify the code to do so .. by the same token,
it might be just as easy to write a quick'n'dirty program in something
else or other to generate kiss frames with the appropriate 'nastygram'
inside ..

Terry

Hi There!

A couple of weeks ago someone posted an artcile regarding a package
called "PacketTracker" which is some kind of Packet Radio Monitoring
program for the Macintosh. Unfortunately I have "lost" the article
and can't locate the software using archie. Any clues???

Regards,

Gazza

Well, I just read the January 93 issue of Boardwatch, which had a nice article in it about packet radio BBSs, and I am now rather interested in the topic. I am not an amateur radio operator yet, but I have enjoyed my SWL hobby for the past couple of years, and tend to take my DX-440 everywhere I go. So, I'm not completely new to radio, but I am almost completely clueless about packet radio. I guess these are the things I would like to see answered in a FAQ. (Having not seen the old one...)

1) What sort of licensing is needed to send and/or receive packets? Is there any additional licensing needed to operate a packet BBS? Do you have to join the ARRL?
2) What hardware is required for receiving and/or sending radio packets? How expensive is it generally? For PBBSs, how does it interface with the computer?
3) About how many PBBSs are there, and what sort of software and messaging do they cater to? Do any have InterNet gateways, or USENET news? How does the TCP/IP protocol fit into all of this?
4) What's the deal with satellites? How do you use them?
5) Where can I find: reviews of hardware, FTP site info, book info, lists of PBBSs currently up, info about ARRL, etc... Maybe ARRL's addresses and phone numbers, too.

I am very interested in all of this, and might actually get involved if it doesn't threaten to drain my poor-college-student wallet too much. I would appreciate any introductory information anybody can point me to.

Hello, Angelo:

I tried using an DR-1200 radio with the MFJ 1270/G3RUH combination, and
could not get
it to work.  The problem was that the Alinco requires 8 volts P/P to
drive it, and the
G3RUH modem that I was using would distort that audio at anything above 3
volt P/P.  I've
read several packet bulletins of other folks using buffer amps between
the modem and the
radio to pick up enough TXD audio to drive the radio for 3.0 khz
deviation.

Good luck.

The subject says it all... someone did tell me this a while ago but I was
clever enough not to save their message. I'd like to know if there are any
implementations of packet TCP/IP software for Linux.

Thanks if you can help.

Hi there people,
Just to let you know that I've arranged with G8BPQ (who is at my home BBS) to
forward any queries from the net about the BPQ node s/w, and forward the
replies back again. To be sure of getting through, it's a good move to mail me
as I don't read this group as often as I should.. :-)

Mail to eeyimkn@unicorn.nott.ac.uk and I'll pass things on.

73's and stuff,
Mike

    I wasn't able to find AmiPac on Archie (regex search). Is it available
on an FTP site? If so, where?

Rob >where do the doc's tell you to interface to on the Alinco?

Rob, The docs with the modem say nothing.. The mod to the radio was supplied by Alinco, it was as follows:

TRANSMITTER

1. Remove R-31
2. Remove C-40 (save this part, it is to be reused!)
3. Connect one leg of C-40 to PIN 7 of the VCO Board
4. Connect a jumper from the free leg of C-40 to the HOT end of C-35
    The MIC input is now connected DIRECTLY to the VCO!

RECEIVER

1. Disconnect the PINK wire connected to the MIC connector and the PC Board from the PC Board
2. Reconnect the PINK wire to PIN 2 on the IF Board connector
    This eliminates the low pass filtering on the discriminator!

The radio works great on 2400 baud, the cables to it are all shielded. All three of the MFJ 9600 baud modems distort at 1/2 a volt p-p for approximately 1.8kHz of deviation. Any Ideas???

Hello, I am having a wee bit of a problem.
Currently, I run version 1.04 of WG7J's NOS program,
and there seems to be a few bugs in it..I think it was from the source code.
Anyway, I want to switch to KA9Q's NOS, but I can't seem to find a reliable
source for the FTP site. Every site that I have tried has a bum version of
it...PKZIP can't unzip it, it says that there are too many errors.
Am I doing something wrong, or what? Is there a kind soul that could help me?
I don't mind getting the source code, in fact that would be a bonus, but I
would like a running copy..

Perhaps someone will help me or point me in the right direction.

I have been using Lan-link 2.00 for about four months as a stand alone program with my 286 vintage computer and had everything working ok.

A week ago I upgraded to a 386 which has Windows and I am somewhat befuddled over the multitasking aspect. I have Lan-link working as a non-Windows application and can run it ok as a single task but I do not seem to be able to properly set up the computer/Windows for multi-tasking to simultaneously run Lan-Link 2.00 in the foreground and a long print job on my Wordperfect 5.1 in the background.

Can someone give me some step by step instructions on how I can do this? I run in 386 enhanced mode, have 2 mb RAM, and apparently do not properly understand the PIF's or something about this. Help is needed!

Thanks, Marv

Another thing which confused me incredibly - when using WNOS (and probably therefore most other systems inc. KA9Q), in multiple sessions it's essential to specify the number of the session, i.e...

record 1 foobar.txt

Same with upload. I took ages trying to work this one out %-\

I'm trying to recompile the JNOS source code, with with everything
but what I need "turned off" to save memory.

The problem is, even though I've UNDEF'ed everything in the config.h
the .EXE comes out even bigger than the usually distributed version.
What do I need to do to exclude the stuff I don't need?

I'm using Borland C++ 3.0

Thanks,
Chris

As I recall, the last step in JNOS compilation is using PKLITE to compress the
executable. Are you doing this?

When JNOS is compiled, the resulting image is processed through a utility
called PKlite. Pklite compresses the executable image by about 50% and adds
a small piece of code to uncompress it automaticaly when you run NOS.EXE. Note
that this makes the image look smaller, but in reality it uses no less memory.

Hope this helps...

A couple of notes on Brad's comments on PMP and the Ramsey kit. I don't know
what Ramsey has done concerning PMP as they never contacted us, but the modem
is not terribly special. Andy is now handling PMP as he has graduated and moved
east and mail forwarding from my address to his is subject to my travel schedule
. You can contact him about PMP directly at payne@crl.dec.com about kit stuff.
About modem connections and such I can still answer questions. The software is
posted on helios.tn.cornell.edu in the /pub directory, on CI$, and presumably

still on the 73 BBS, although they had chopped down the full set of data at one point to just those files necessary to run to keep the phones from being so tied up. The CIS and helios postings should include the source and we are interested in any upgrades or improvements that get made to the program.

As far as powering from the serial port - I think the ports are only rated to deliver 20 ma under short circuit conditions, at least the 1488 drivers are - the original port spec might have been 500 ma. In my testing on the computers I could get my hands on, I could get about 7 ma per handshake line before the voltage started to sag. Which is why PMP will turn on two lines to be parallelto supply the power. BTW, the serial port cannot power the version with the timer chip and the led's. That takes about 45 ma, but the simple version which is what I use, only takes about 12 ma total and I've had no problem on any machine I've tried.

I'm not sure what Brad meant about the serial line problem on the PTT on his HT, PMP uses only the parallel port for PTT. D0 and D1 are used for TX data and PTT and the two input lines error and ack are used for carrier detect and RX data. We used the parallel port because it didnt' require the level shifting and simplified the modem and because the parallel port is almost always free on a laptop in the field.

Hope that helps.

Check out "ftp.ucsd.edu" and it's mirrors (such as cs.uwp.edu).

The directory hamradio/packet/tcpip/amiga has Amiga NOS in it.

I am trying to get a TCP/IP station running under the Coherent OS. I
tried Randy Wright's port of an older version of NOS, but it is not
stable with the AX25 stuff (he only worked on the SLIP stuff).   Also,
the mailer wasn't sorted out yet. I found the k5jb software on ucsd.edu
the other day, and that appears to have been ported. Any other suggestions?

I am a college student with too many classes, so I don't have lots of time
to test every port that comes along; otherwise I would probalby port
something like j-nos or w-nos.

Thanks for the advice,
Ken Friberg n8pbe

In northern california you will find tcp/ip stations operating on 145.75
there may be some tcp/ip activity in sacramento on 144.93. Some of the
nodes will accept ax.25 connections to get you started. Have fun.

                ^^^^
Paul, I certainly agree.. especially on the 56K idea...
it's enough trouble to build
networks without taking baby steps... If I could buy
1.5 MBS systems and make them work over the distances that
we have to here in the foothills of N. Ga.. I would buy
them... as it is, we have 56KB, so we use it...

>One of the ideas that we have is that each point to point link is on its own
>channel (multiple transceivers), another is that there is only one

>transmitter per site, but multiple receivers. In either case, we certainly
>need more than two ports per node.

Technically, I agree with the second approach..
we probably should make the 56K modems
available as receive or transmit only kits... it's designed
that way, we have never advertised a price.. it causes certain
problems in stocking, etc... but it's certainly "do-able"...

Back in 87 or so when we were planning out the GRAPES network.. I proposed
essentially what you have proposed.. I was "yelled down" by the rest
of the networking committee suggesting that my solution was too
expensive (both in time and money).. they wanted to go simplex initially...

I have to admit that looking back now in 1993, I must agree with them....
we have progressed... but it was hard enough to accomplish
even with this simplest of implementations . But we have participation
from Augusta, Ga Across N. Ga to Alabama and into Tennessee.. most of
it is up and running at 56K.. It's been a hard road... but every step
we've taken has been to make whatever we do permanent..., supported by a
group...

I still believe "HEXNET" (or single transmitter at each site and
multiple receivers, one for each transmitter in range) is the
correct technical solution. Practically, I believe that it would
have held us back .. also, it's not impossible to migrate to
the "HEXNET" (I think that's what someone was calling it a few years
ago) concept from Simplex... you just have to make up your own mind
what you want:...

1) shortest implementation plan with lowest risk
     that you will not get it implemented before patience runs out

or

2) Best technical solution (or if you can't do it the best way, don't start...)

>As ease of use (user transparency) is very important, a multiple NET/ROM or
>TheNet hookup is not acceptable.

interesting... I thought that many packeteers wanted a user interface
that hid the topology of the network from the users... (as well as
the capability to override it).. which the GRAPES network gives them...

>Any ideas?

Lay the groundwork for a simple to implement network.. then build on it...
stick to funding network nodes that are maintained by local groups... not
individuals (they burn out and leave you cut off)... Don't forget
that there are limits to propagation at the higher freqs... especially
in hilly country (like the foothills of N. Ga) and very limited allocations
for packet radio at the lower freqs... it's a tradeoff all the way...

If you are trying to build a temporary network for play... you can get
away with a lot more focus on technology and "flash in the pan" type
of planning... if you wish for your network to last.. people are more important
than technology... Brian Kantor said it very well in his posting about
working together being tough for Hams... Hams work together well within
a local organization.. that's why there are so many repeaters... but
the linking between organizations requires cooperation over a long
distance.. THAT'S TOUGH!!!!!!

Publishing is important... Newsletters, etc are the lifeblood of an
organization... We've fallen down in that area.. it has hurt us...
If we didn't have funding (56k modem sales) we would have long since failed...
I believe that publishing can do a lot to offset lack of internal funding.
(wish we had a someone willing to do a newsletter).

Sorry for the soap box.. you touched a soft spot in my head... .. Packet Radio
Networking.

and.... we had a "KILLER" GRAPES networking committee meeting yesterday here
in Georgia...
16 networkers showed up from as far away as Augusta, Ga, Auburn, Alabama and
Nashville, Tenn... These were "hard core" do'ers, not users...

It was AWESOME!!!...

Hope to see some of you guys/gals at the ARRL National Convention this August
in Huntsville, Ala.. ALANET and GRAPES are cooperating to set up the
packet radio forums and demos... CU there...

Doug

Lines: 64

A new release of the PA2AGA version of NET/Mac, version 2.3.15 has recently been posted. There have been some major new function added to this release and the purpose of this notice is to explain some of those enhancements.

o New AppleTalk Driver Code

The previous version of NET/Mac used a driver which supported the AppleTalk (AT) Link Access Protocol (LAP). As a result, a user was limited to being able to only establish sessions with other users on the same AT network. The new release uses a Datagram Delivery Protocol (DDP) driver which now supports establishing connnections with all users in the same AT zone. All problems with checksum errors that were a result of the old LAP-based code have been corrected.

o Support of MacIP Protocol

This release of NET/Mac supports the MacIP protocol. This means that NET/Mac can now support AT gateway products such as the Shiva FastPath and Cayman Gatorbox. As a result, NET/Mac can now pass packets to an Ethernet IP network via any gateway product which supports the MacIP protocol for encapsulating IP in AT DDP packets.

NET/Mac can also now interoperate with Apple's MacTCP product. This means that any Macintosh application which supports MacTCP, such as NCSA TELNET can now talk to NET/Mac over an AT network. Please note that NET/Mac and MacTCP can not run on the same machine at the same time as there will be a conflict over the use of the MacIP socket.

o Support for the SLFP Protocol

NET/Mac now supports the MIT Serial Line Framing Protocol (SLFP) which is used at MIT and the Merit Computer Network. This support has been available in NOS for sometime and as a result of user requests it has been added to NET/Mac.

o Support for the Buckmaster HamCall CD-ROM

NET/Mac now supports the format used for the callsign database provided on the Buckmaster HamCall CD-ROM. The callsign database format used in previous versions is no longer supported. Anyone interested in using the callsign database lookup support should contact Buckmaster for information on obtaining their CD-ROM.

This new release is available in the incoming directory of ucsd.edu. It is also available at all SUMEX mirror sites and America Online. Any support questions or comments should be directed to myself or Adam van Gaalen PA2AGA at adam@IGG.TNO.NL.

I'm looking for a morse code tutorial program for the Amiga - something freeware. Currently, the only such programs I have been able to find are morse1.2.lzh, which is cripple-ware and some AmigaBASIC programs from 1988.

Any help would be appreciated.

Just to clear this up. The Ramsey kit is designed for connection to a PC
serial port using the Baycom software. I had problems with the PTT signal
in that configuration and used the *alternate* *parallel* port wiring for
use with Kevin's and Andy's PMP software.

My brother is contemplating becoming a ham and getting on packet where he
lives in San Diego, however he was somewhat concerned that they use pls
on the nodes and tcp/ip repeaters since he wants to buy a used 2m rig that
does not have tones. I am quite certain he has nothing to worry about but
wanted to check first before advising him to buy the radio. Also, are most
of the 2m voice repeaters in San Diego pl'd?

Thank you for your time,

     -Andrea, WS1C

>load is high enough to justify it -- we'll put users on one repeater
>and servers on the other.

>>Later, when there are more than two 9600 bps USER stations on the air in
>>town, we'd upgrade the repeater to 56kb.

The same approach is used here in Ottawa, except that we went directly to 56kb. Our full-duplex 56kb repeater has been on the air for more than 3 years now, and the 56kb network (currently with 7 nodes) has become the backbonefor the area. We plan to multicouple a second high-speed repeater in parallel with the original, sharing the rf equipment... but right now the repeater handles the local traffic with ease. Some of the 56kb stations provide network access on 2m to small "cells" around them, and some have trunks to other areas (see my article in the '91 CNC for more details).

Using fdx repeaters for linking as well as user LANs should be given serious consideration. Take a hypothetical situation where you want to link 3 network nodes that can't hear each other. You could a find a suitable site with good paths to the 3 nodes and put up a 3-port packet switch, with hdx or fdx point-to-point links to each node. This is an expensive proposition, with lots of equipment to maintain at a site that may not be readily accessible. If a 4th node comes along which is hidden from the others and needs to be linked, things get very messy. Now consider putting a repeater on the site instead... now the equipment on the site is very simple and easy to maintain. The equipment needed to link through the repeater is likewise simple, and it is the same for each node. Adding another node is a trivial proposition, and your expensive packet switch hardware is mostly at home stations instead of up on the hill, so it is easier to maintain. You're also using up less spectrum... of course, the repeater has to support a data rate which can handle the combined traffic. This isn't the answer when we want get trunks going at T1 rates and beyond, but it *will* solve a lot of today's networking problems.

I have been using PB920224, but I have a problem. The
"dofile.bat" batch file which cleans up the messages
after they have been downloaded calls "phs." What is
phs? Where can I get a copy of it via ftp?

Hi, this site is in Stuttgart, Germany !

This is a FTP server for the Ham Radio community, especially to support
system operators of the PacketCluster software package.

NEW: /pub/contest   - contesting software and utilities.

See /pub and directories below for downloadable stuff.

You can upload files You want to make accessable to the public to the
directory "/pub/uploads" - please leave an appropriate *.txt file describing

your upload.

There is also a mailing list forum for PacketCluster system operators:
to get more information, send an email to
listserv@ifsws1.sozialforschung.uni-stuttgart.de
with a message body of "HELP".

Please report problems and suggestions to

Frank Grossmann (DL1SBR)

gross@ifsws1.sozialforschung.uni-stuttgart.de

How difficult would it be to DF a packet station on 1) a clear channel with
only the fox transmitting, and 2) on a shared channel with multiple users?

This could be a new source of aggrevation for the fox hunting masochist!

Hello,

I am not sure this is the right mailing list to send my question to.
If not i am very sorry.

I am searching for some information about the DRSI driver and the
PCPA card. Can someone help me to get these information:
     1- What are the features of such a card.

2- Compared to others, What are its advantages
3- What other equipments should i get to have communication
over packet radio
4- Is there an email address of the manufacturer of this
card and those of others (if any).

Any help will be greatly apreciated.
thank you
khaled.

AMPRNet IP address coordinators as of 15 December 1992

Corrections and updates to brian@ucsd.edu.

Note: the people listed here have volunteered to issue IP addresses for
their areas. They are not paid to do this service; please understand that
they are perfectly at ease to deal with coordination responses at a
reasonably lower priority than the things that matter more, such as
job and family. Please be patient when requesting an address.

>Packet radio is digital communications via amateur radio. Packet radio
>takes any digital data stream and sends that via radio to another
>amateur radio station. Packet radio is so named because it sends the
>data in small bursts, or packets.

>1.2 What is amateur radio?

>Amateur Radio (sometimes called Ham Radio) is individuals using
>specified radio frequencies for personal enjoyment, experimentation,
>and the continuation of the radio art. Amateur radio operators must be
>licensed by their government. In the United States, the Federal
>Communications Commission issues amateur radio licenses. Normally, a
>test on operating practices, radio theory, and in some cases morse code
>proficiency test is administered. Amateur radio is not to be used for

>commercial purposes. Also, amateur radio operators are restricted from
>using profanity and using amateur radio for illegal purposes.

>For more information on Amateur Radio in general, see the monthly
>frequently asked questions posting in rec.radio.amateur.misc. A copy
>of that FAQ is also available from ftp.cs.buffalo.edu.

>1.3 What can I do on packet radio?

>Keyboard-to-Keyboard contacts:

>Like other digital communications modes, packet radio can be used to
>talk to other amateurs. For those who cannot use HF frequencies, two
>amateurs can talk to each other from long distances using the packet
>radio network.

>Packet BBS operations:

>Many cities have one or more packet Bulletin Board System (BBS) available
>on the local packet network. Amateurs can check into the BBSes and read
>messages from other packet users on almost any topic. BBSes are
>networked together over the packet network to allow messages to reach a
>broader audience than just your local BBS users. Private messages may also
>be sent to other packet operators, either locally or who use other
>BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins.
>Many BBSes have a file section containing various text files full of
>information on amateur radio in general.

>DX Packet Cluster:

>A recent development is use of packet radio for DX spotting. HF
>operators connect to the local DX Packet Cluster for the latest reports
>on DX. Often a user will 'spot' some hot DX and distribute the DX
>report real time.

>File Transfer:

>With special software, amateurs can pass any binary files to other
>amateurs. Currently, this is done with TCP/IP communications, YAPP,
>and other specialized protocols.

>Satellite Communications:

>Many of the amateur radio satellites contain microcomputer systems that
>can provide special information to amateurs. Some satellites contain
>CCD cameras on board and you can download images of the earth and the
>stars. Others provide store and forward packet mailboxes to allow
>rapid message transfers over long distances. Some satellites use
>AX.25, some use special packet protocols developed for satellite
>communications. A few transmit AX.25 packets over FM transmitters, but
>most use SSB transmissions.

>1.4 Why packet over other digital modes?

>Packet has three great advantages over other digital modes:
>transparency, error correction, and automatic control.

>The operation of a packet station is transparent to the end user;
>connect to the other station, type in your message, and it is sent
>automatically. The Terminal Node Controller (TNC) automatically
>divides the message into packets, keys the transmitter and sends the
>packets. While receiving packets, the TNC automatically decodes,
>checks for errors, and displays the received messages. In addition,
>any packet TNC can be used as a packet relay station, sometimes called a
>digipeater. This allows for greater range by stringing several packet
>stations together.

>Packet radio provides error free communications because of built in
>error detection schemes. If a packet is received, it is checked for
>errors and will be displayed only if it is correct.

>With VHF/UHF packet, many countries allow packet operators to operate
>in automatic control mode. This means that you can leave your packet
>station on constantly. Other users can connect to you at any time they
>wish to see if you are home. Some TNC's even have Personal BBSes
>(sometimes called mailboxes) so other amateurs can leave you messages
>if you are not at home.

>Another advantage of packet over other modes is the ability for many
>users to be able to use the same frequency channel simultaneously.

>1.5 What elements make up a packet station?

>TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the
>associated circuitry required to convert between RS-232 and the packet
>radio protocol in use. It assembles a packet from some of the data on
>the serial line, computing an error check (CRC) for the packet, modulates
>it into audio frequencies, and puts out appropriate signals to transmit
>that packet over the connected radio. It also reverses the process,
>translating the audio that the connected radio receives into a byte
>stream on the RS-232 port.

>Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF
>packet, and 300 BPS for longer distance, lower bandwidth HF
>communication. Higher speeds are available for use in the VHF, UHF, and
>especially microwave region, but they often require unusual hardware and
>drivers.

>Computer or Terminal: This is the user interface. A computer running a
>terminal emulator program, a packet-specific program, or just a dumb
>terminal can be used. For computers, almost any phone modem communications
>program can be adapted for packet use, but there are also customized packet
>radio programs available.

>A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM
>voice radios are used. For HF packet, 300 BPS data is used over
>single side band modulation. For high speed packet (anything greater
>than 1200 BPS), special radios or modified FM radios must be used.

>1.6 What do you mean we can all use the same channel?

>Packet radio uses a protocol called AX.25. AX.25 specifies channel
>access (ability to transmit on the channel) to be handled by CSMA
>(Carrier Sense Multiple Access). If you need to transmit, your TNC
>monitors the channel to see if someone else is transmitting. If no one
>else is transmitting, then the TNC keys up the radio, and sends its
>packet. All the other stations hear the packet and do not transmit
>until you are done. Unfortunately, 2 stations could accidentally
>transmit at the same time. This is called a collision. If a collision
>occurs, neither TNC will receive a reply back from the last packet it
>sent. Each TNC will wait a random amount of time and then retransmit
>the packet.

>In actuality, a more complex scheme is used to determine when the TNC
>transmits. See the "AX.25 Protocol Specification" for more
>information.

>1.7 What is AX.25?

>AX.25 (Amateur X.25) is the communications protocol used for packet
>radio. A protocol is a standard for how two computer systems are to
>communicate with each other, somewhat analogous to using business format
>when writing a business letter. AX.25 was developed in the 1970's and
>based of the wired network protocol X.25. Because of the difference in
>the transport medium (radios vs wires) and because of different
>addressing schemes, X.25 was modified to suit amateur radio's needs.
>AX.25 includes a digipeater field to allow other stations to
>automatically repeat packets to extend the range of transmitters. One
>advantage of AX.25 is that every packet sent contains the sender's and
>recipient's amateur radio callsign, thus providing station identification
>with every transmission.

>1.8 Definitions: Commonly used terms in Amateur Packet Radio

>44 net - The class A network designator for TCP/IP amateur packet
>radio. All numerical TCP/IP addresses are in the format
>44.xxx.xxx.xxx.

>AFSK - Audio Frequency Shift Keying. A method of representing
>digital information by using different audio frequencies modulated on
>a carrier.

>AMPR - Amateur Packet Radio.

>ampr.org - The high level domain recognized on Internet for amateur
>packet radio TCP/IP.

>AX.25 - Amateur X.25 protocol. The basis of most packet systems.
>See section 1.7 for more information.

>CRC - Cyclic Redundancy Check. The error detection scheme included
>in each packet. Verify that the packet was received error free.

>CSMA - Carrier Sense Multiple Access. A system allowing many
>stations to use the same radio frequency simultaneously for packet
>communications.

>digi - Short name for a digipeater

>digipeater - A packet radio station used for repeating packets. See
>section 3.3.1 for more information.

>FCC - Federal Communications Commission. Regulates and issues
>licenses for amateur radio in the United States.

>FM - Frequency Modulation. The radio modulation scheme used for VHF
>and UHF packet communications.

>FSK - Frequency Shift Keying. A method of representing digital
>information by shifting the radio carrier frequency different amounts
>to represent ones and zeros.

>HDLC - (High-Level Data Link Control Procedures) A standard for high
>level link control. (ISO 3309)

>KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program
>originally developed by Phil Karn, KA9Q. Currently there are many
>different versions available. See section 3.2 for more information.

>KA-Node - A simple networking scheme developed by TNC maker
>Kantronics. See section 3.3.2 for more info.

>KISS - Keep It Simple Stupid. A simple interface developed for
>communications between TNCs and computers. This allows for most of
>the packet processing to be handled by the computer. Commonly used
>with packet TCP/IP software.

>LAN - Local Area Network. A packet network developed for
>communications throughout a city or region. Often, the LAN uses
>separate frequencies from inter-city packet links.

>modem - MODulator/DEModulator. Converts the analog signals into
>a binary data stream (a series of ones and zeros) for the TNC or a
>micro-computer. First step in decoding packets. It also converts
>binary data to analog, which is the last step in encoding packets.

>NET/ROM - A scheme for packet radio networking. See section 3.3.3
>for more information.

>NODE - A network node. Often a network node running NET/ROM.

>PPP - Point to Point Protocol. PPP is another protocol used for moving
>IP frames over a serial line. It supports host authentication, and non-
>transparent serial lines. It also has a standard way of negotiating
>header (and potentially data) compression over the line. See also SLIP.

>protocol - A standard used for intercommunications between different
>computer systems.

>RS-232 (RS-323C) - A (more or less) standard for interconnection of
>serial peripherals to small computer systems. In packet radio,
>RS-232 is the most common interface between TNC's and the
>Computer/Terminal.

>SLIP - Serial Line Internet Protocol.   A trivial protocol for putting
>IP frames over a serial line to do (potentially) cheap TCP/IP networking.
>Approximately the same as KISS, except over wireline networks. See also
>PPP.

>SSB - Single Side Band. The radio modulation scheme used for HF packet
>and satellite packet communications.

>TAPR - Tucson Amateur Packet Radio. Was the first group to create a
>packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many
>others. TAPR continues development of packet radio equipment.

>TCP/IP - Transmission Control Protocol/Internet Protocol. A set of
>utility programs used over AX.25. See sections 3.2 for more
>information.

>TNC - Terminal Node Controller. See section 1.5 for more
>information.

>1.9 Do's and Don'ts : Rules and Regulations

>NOTE: These regulations apply only to amateurs regulated by the FCC
>(United States), but often are similar to regulations in other
>countries.

>[Since I have no experience with amateur radio in other countries, I
>cannot make any comments. Please bring any notable exceptions to my
>attention. -ed]

>Although there are no specific rules that apply to amateur packet
>radio, the general amateur radio rules force some restrictions on
>packet usage.

> Can I set up a TNC at home and one at work so I can check my
> Electronic mail via packet?

>This cannot be done without special restrictions. Amateur radio
>rules prohibit any business. Since you could have mail from your
>boss (or maybe even someone selling you something over Internet),
>that would constitute business activity and is specifically
>prohibited.

>Profanity can also be a complication. Since you have no control over
>the language used in E-mail, proper filtering is required. Since no
>filter scheme can catch every offense, it is best to say every
>message must be hand filtered.

> I would like to set up a packet radio gateway between a land line
> computer network and the packet network. Is this possible?

>Yes, and there are several such gateways in use, but they must be
>managed with caution. Electronic mail may be passed FROM the packet
>network INTO the land line network without intervention. However,
>mail passed TO packet radio is considered third party traffic (the
>sender is not an amateur) and these messages must be hand filtered to
>ensure that rules of message content are followed.

> It's my license if I use packet radio illegally anyway, so what does
> anyone else care!?

>Packet radio is one of the few NETWORKED systems in amateur radio.
>Many people have helped develop the network and there are many
>amateurs who own parts of the packet radio network. Sending packet
>BBS mail, digipeating, and sharing the channel involves the licenses
>of MANY people. Because of FCC rules stating that anything to come
>out of a transmitter (either in automatic mode or via your direct
>control) is the licensee's responsibility, one illegal message sent
>over the packet radio network could literally jeopardize the licenses
>of thousands of other amateurs. When in doubt, it is best to check
>with other amateurs about sending the message before it is sent.

> I have some ideas on how to use packet radio in a new way, but I
> don't know if it is legal. Who could tell me if I can do it
> legally?

>The worst thing you can do is talk to the FCC about such an issue. The
>FCC rules are written to be general enough to encompass but not
>restrict new radio activities. In the past, any non-thought-out
>requests sent to the FCC have meant a reduction of privilege for all
>amateur radio operators.

>The best source for legal assistance is your national amateur radio
>association. In the United States, that is the American Radio Relay

>League (ARRL). Another good place for such conversations is over
>Usenet/packet mailing lists, or the amateur radio BBS network.

>2 Computing Network Resources for Amateur Packet radio

>This section summarizes the resources available on Internet for amateur
>packet radio operators.

>2.1 What Newsgroups/mailing lists are available?

>This is a list of all groups that regularly discuss amateur packet
>radio. For newsgroups, join the group through use of your news
>reader.   For mailing lists, add a '-request' to the end of the list
>name to request subscriptions. For listserv groups, send mail to
>'listserv' at the node which contains the list. The first line of the
>mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help'
>for more information.

>rec.radio.amateur.packet (Newsgroup): General discussions involving
>Packet Radio.

>rec.radio.amateur.misc (Newsgroup): General amateur radio discussion.
>Usually does not contain any particular information about Amateur
>Packet Radio.

>rec.radio.amateur.policy (Newsgroup): Discussion of regulation
>policies regarding every aspect of amateur radio. Occasionally deals
>with policies of packet coordination and legal issues of packet radio.

>rec.radio.swap (Newsgroup): General For-Sale for any radio equipment.
>Occasionally will have packet equipment for sale. Recommended location
>for any amateur packet radio for-sale items.

>info-hams@ucsd.edu (Listserv group): A digest redistribution of the
>rec.radio.amateur.misc Usenet discussion.

>packet-radio@ucsd.edu (Listserv group): A digest redistribution of the
>rec.radio.amateur.packet Usenet discussion.

>ham-policy@ucsd.edu (Listserv group): A digest redistribution of the
>rec.radio.amateur.policy Usenet discussion

>hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed
>modems and radios available and future plans. Also includes discussion
>of networking using high speed modems.

>tcp-group@ucsd.edu (Mailing list): Group discussion of technical
>developments of TCP/IP over packet radio and use of the NOS TCP/IP
>programs.

>gateways@uhm.ampr.org (Mailing list): Discussion of current gateways

>and future plans for gateways. May deal with sensitive internetworking
>issues.

>For all lists at ucsd.edu, archives may be found via anonymous FTP at
>ucsd.edu. Some listserv groups also have archives. Send the command
>'help' to the group's listserv for more information. Digest mailings
>for the ucsd.edu discussions are also available. Send mail to
>listserv@ucsd.edu with the first line being 'longindex' for more
>information.

>2.2 What anonymous FTP sites are available for getting packet radio
>information and programs?

>This is a sampling of FTP sites that carry amateur packet radio related
>files. Consult the Archie archive server for info on locating
>particular files. For more information on using archie, send mail to
>archie@cs.mcgill.edu with the line 'help'.

>ucsd.edu

>Primary distribution site of KA9Q's derived TCP/IP packages. Also,
>general packet radio information in the /hamradio/packet subdirectory.

>wsmr-simtel20.army.mil

>Very large collection of amateur radio software.

>wuarchive.wustl.edu

>Mirror site of Simtel20 archives. Unix directory structure, which is
>easier to use then the simtel20 archive.

>ftp.cs.buffalo.edu

>Supplimental archive site for amateur radio information. Contains
>current copies of all rec.radio.amatuer.* FAQ's.

>tomcat.gsfc.nasa.gov

>Packet software including Baycomm, ROSE, G8BPQ, NOS, etc.

>akutaktak.andrew.cmu.edu

>SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
>SoftKiss is an init/cdev/driver that allows a MAC to do packet using
>a Poor Man's Packet modem.

>sumex-aim.stanford.edu

>NET/Mac is the port of KA9Q's NET program. It doesn't have nifty features
>like scrolling or saving the windows, but the individual sessions can be

>recorded into a file.

>2.3 How do I contact the ARRL via electronic mail?

>There are various addresses at ARRL HQ, but the most important one is
>probably info@arrl.org. That is where general information about the
>ARRL can be acquired. This address reaches a person, so you'll have
>to specify what/who you're looking for.

>2.4 Are there any gateways for mail or news between Internet and
>Amateur Packet radio?

>Internet / Packet Radio BBS Gateway

>Jim Durham, W2XO, maintains a gateway between Internet and the Packet
>radio BBS system.

>To mail from Internet to Packet:

>1.   Mail to: "bbs@w2xo.pgh.pa.us"

>2.   Make the first line of the text a Packet BBS "send" command, ie:
>SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

>3.   The "subject" line of the Internet mail becomes the "title" line
>of the Packet BBS mail.

>NOTE: Because of FCC regulations, Jim must hand filter each message
>sent FROM Internet TO the Amateur Packet Radio BBS system. Messages
>should be of minimal length and appropriate content. Read Section 1.9
>(Do's and Don'ts: Rules and Regulations) regarding appropriate usage of
>packet radio for more information. Always include the routing hints
>with the BBS callsign.

>To mail from Packet to Internet:

>1.   The amateur radio operator must have his callsign registered in
>the gateway alias list. If you want to mail from packet to a specific
>amateur on Internet, send mail to 'durham@w2xo.pgh.ps.us' (Internet) or
>'W2XO @ W2XO.#WPA.PA.USA.NAOM' (Packet BBS mail) with his/her amateur
>callsign and their Internet address.

>2.   Once the above is accomplished, packet BBS mail should be sent to
>'CALL @ W2XO.#WPA.PA.USA.NAOM'. The mail will automatically be
>forwarded to the Internet address of the amateur with the 'CALL'
>callsign.

>Jim Durham's Internet address is 'durham@w2xo.pgh.ps.us'.

>LAN Gateways (Packet wormholes via Internet)

>Currently a group of amateurs are experimenting with connecting packet
>LANs together via Internet IP inside IP Encapsulation. Some of the
>gateways only accept TCP/IP packets, others AX.25 packets. These
>gateways uses the Internet as a transport medium, thus it is impossible
>to access the packet radio network from Internet. For more
>information, join the Gateways mailing list by sending mail to
>"gateways-request@uhm.ampr.org".

>3 Networking and special packet protocols

>This is a sample of some of the more popular networking schemes
>available today. By far, there are more customized networking schemes
>used than listed. Consult your local packet network guru for specific
>network information.

>3.1 Are there any other protocols in use other than AX.25?

>AX.25 is considered the defacto standard protocol for amateur radio use
>and is even recognized by many countries as a legal operation mode.
>However, there are other standards. TCP/IP is used in some areas for
>amateur radio. Also, some networking protocols use other packet
>formats than AX.25.

>Often, special packet radio protocols are encapsulated within AX.25
>packet frames. This is done to insure compliance with regulations
>requiring packet radio transmissions to be in the form of AX.25.
>However, details of AX.25 encapsulation rules vary from country to
>country.

>3.2 What is TCP/IP?

>TCP/IP stands for Transmission Control Protocol/Internet Protocol.
>This is commonly used over the Internet wired computer network. The
>TCP/IP suite contains different transmission facilities such as FTP
>(File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet
>(Remote terminal protocol), and NNTP (Net News Transfer Protocol)

>The KA9Q NOS program (also called NET) is the most commonly used
>version of TCP/IP in packet radio. NOS originally was written for the
>PC compatible. However, NOS has been ported to many different
>computers such as the Amiga, Macintosh, Unix, and others. Smaller
>computers like the Commodore 64 and the Timex-Sinclar do not currently
>have version of NOS available.

>3.3 Networking Schemes

>What are some of those other networking schemes?

>During the early days of amateur packet radio, it became apparent that
>a packet network was needed. To this end, the following packet network
>schemes where created.

>Digipeaters

>The first networking scheme with packet radio was Digipeaters.
>Digipeaters would simply look at a packet, and if its call was in the
>digipeater field, would resend the packet. Digipeaters allow the
>extension of range of a transmitter by retransmitting any packets
>addressed to the digipeater.

>This scheme worked well with only a few people on the radio channel.
>However, as packet became more popular, digipeaters soon were clogging
>up the airwaves with traffic being repeated over long distances. Also,
>if a packet got lost by one of the digipeaters, the originator station
>would have to retransmit the packet again, forcing every digipeater to
>transmit again and causing more congestion.

>KA-Nodes

>Kantronics improved on the digipeater slightly and created KA-Nodes. As
>with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a
>KA-Node acknowledges every transmission each link instead of over the
>entire route. Therefore, instead of an end-to-end acknowledgement,
>KA-Nodes allow for more reliable connections with fewer timeouts, because
>acknowledgments are only carried on one link. KA-Nodes therefore are
>more reliable than digipeaters, but are not a true network. It is
>similar like having to wire your own telephone network to make a phone
>call.

>NET/ROM

>NET/ROM was one of the first networking schemes to try to address the
>problems with digipeaters. A user connects to a NET/ROM station as if
>connecting to any other packet station. From there, he can issue
>commands to instruct the station to connect to another user locally or
>connect to another NET/ROM station. This connect, then connect again,
>means that to a user's TNC, you are connected to a local station only
>and its transmissions do not have to be digipeated over the entire
>network and risk loosing packets. This local connection proved to be
>more reliable.

>NET/ROM doesn't use all of the AX.25 protocol. Instead, it uses
>special AX.25 packets called Unnumbered Information (UI) packets and
>then puts its own special protocol on top of AX.25. This is again
>used to increase efficiency of its transmissions.

>NET/ROM is a commercial firmware (software put on a chip) program that

>is used as a replacement ROM in TAPR type TNC's. Other programs are
>available to emulate NET/ROM. Among them are TheNet, G8BPQ node
>switch, MSYS, and some versions of NET.

>NET/ROM nodes, at regular intervals, transmit to other nodes their
>current list of known nodes. This is good because as new nodes come
>on-line, they are automatically integrated in the network. However, if
>band conditions such as ducting occur, ordinarily unreachable nodes can
>be entered into node lists. This causes the NET/ROM routing software to
>choose routes to distant nodes that are impossible. This problem
>requires users to develop a route to a distant node manually defining
>each hop instead of using the automatic routing feature.

>ROSE

>ROSE is another networking protocol derived from X.25. Each ROSE node
>has a static list of the nodes it can reach. For a user to use a ROSE
>switch, he issues a connect with the destination station and in the
>digipeater field places the call of the local rose switch and the
>distant rose switch the destination station can hear. Other then that,
>the network is completely transparent to the user.

>ROSE's use of static routing tables ensures that ROSE nodes don't attempt
>to route packets through links that aren't reliably reachable, as NET/ROM
>nodes often do. However, ROSE suffers from the inability to automatically
>update its routing tables as new nodes come online. The operators must
>manually update the routing tables, which is why ROSE networks require
>more maintainance.

>3.4 BBS message transfer

>Many of the BBS programs used in packet radio allow for mail and
>bulletins to be transferred over the packet radio network. The BBSes
>use a special forwarding protocol developed originally by Hank Oredsen,
>W0RLI.

>Besides full service BBSes, many TNC makers have developed Personal BBS
>software to allow full service BBSes to forward mail directly to the
>amateur's TNC. This allows operators to receive packet mail at night
>and avoid tying up the network during busy hours.

>--

Hi, I'm looking for more information on packet radio than is
provided by the FAQ. I'm not interested in technical details so much as
gaining a broad understanding of just what the state of the art is.
Hi, I'm looking for more information on packet radio than is
provided by the FAQ. I'm not interested in technical details so much as
gaining a broad understanding of just what the state of the art is.
My ideal scenario would be this: I'm travelling around Europe, the USA
or
wherever in a campervan, and am able to use packet radio to send and
recieve email, gatewayed to the Internet. (I wouldn't expect to be able
to keep up with alt.*)
My ideal scenario would be this: I'm travelling around Europe, the USA
or
wherever in a campervan, and am able to use packet radio to send and
recieve email, gatewayed to the Internet. (I wouldn't expect to be able
to keep up with alt.*)
How possible is this?
How possible is this?
I'm sure I'll have some more detailed questions when I understand a bit
more, but for now I would be grateful if someone could point me in the
direction of more packet radio info.
I'm sure I'll have some more detailed questions when I understand a bit
more, but for now I would be grateful if someone could point me in the
direction of more packet radio info.

Thanks,
Tom
Thanks,
Tom

Greetings,

I have just closed a deal on a RCA-700 transceiver. The fellow that I bought it from told me that there were a lot of them in use in the Texas TEXNET. He further indicated that it had meen converted for use on 446.1 mhz using TEXNET modification instructions.

The bad news is that he did not have any documentation. I would really like to get my hands on the manual/schematics for the RCA-700 and the conversion documentation published by TEXNET.

If there is anyone that can put me in touch with someone in TEXNET ?

In early December, I inquired of the group about a problem with nodes running TheNET X1H as follow:

1) ARP and IP router functions either don't respond or respond with packets that contain binary trash. PING to the router also fails.

2) Tests with X1G work correctly. All nodes involved in the test have parameters identical to those used with the X1H firmware when it failed.

Software used includes an 286 MSYS 1.13 node, a 386 and a Sun 4/75 running GRI 1.7j.

Jan Barglowski reported similar problems. Since the X1H firmware has been released for a longer period of time now, I am wondering if anyone else may have experienced similar problems. For that matter, has anyone

used X1H for an IP switch successfully?

i recently bought an mfr1270b for packet. when i got it out of the box and turned it on i found it was generating a very strong signal at 144.979 Mhz. in fact it is strong enough that my son could send me signals with about 50 feet seperating the 1270b and my ht. is this normal or do i need to send it back :(

as a side note has anyone connected a dj580 and an mfj1270 together. specifically what value of resistor do i need to activate the ptt line.

Greetings,

A fellow ham just dug an AEA PKT-1 tnc out of his used equipment box and asked if it will get him up and on the air with our local bbs. Can anyone tell me about this tnc? I would like to know if it will do KISS mode operations and or if it is TAPR TNC-2 compatible.

Anyone familiar with this beast?

It is ABSOLUTELY FALSE that nodes and packet repeaters use PL in San Diego. As the person who built, installed, and maintains the packet repeater and more than half of the nodes, I can assure you that they do NOT use PL.

At the moment I am pretty new to amateur radio but would like to know some
info about connecting and using amateur satellites on 2m and 70cm
I would like to hear from people (especially from Sydney Australia) about
how they have achieved connections and describe what kind of setup you are using
(radio , antenna etc).
Also is it difficult (or possible) to DX on 2m and 70cm using repeaters or
satellites

Any info or help appreciated
Regards
Jose

Greetings,

We have been using the X1H release since early December in the Culpeper, Virginia area. It is running in a PACOMM Tiny-2 (upgraded to 10mhz) and it is the primary TCP/IP router for this area. We did have a single occurance where the IP routing functions on the node seemed to just stop. As the NETROM and AX25 functions all worked it took a couple of days to recognize where the problem was. We did a remote reset, reloaded the arp and rout entries and it has run without a glitch for the last four weeks. The local TCP/IP nodes are all running JNOS. The only other traffic is simple AX25 stuff. The NETROM stuff is working fine, all thought we do not use it. I have never been able to get the X1G or X1H node to return a ping. However, I suspect that this has something to do with the fact that the node call is KD4PWU-5 and my JNOS bbs call is KD4PWU-8. Other stations on the network have been able to ping both versions without a problem (I think). The primary reasons we chose to use the X1x versions are the IP routing and talk capabilities.

Hope this helps......

Ralph its a good question. I have an interest in someday working for the
University of the South Pacific at Fijji and would like to know the answer
too.

I suggest you send a packet message to all @ ALLOC.oc and see what kind of
response you get. Good luck. 73 Terry

This is normal, though the exact frequency varies. It's a multiple of
the microprocessor clock. There are two things you can do. You can get
rid of it by scraping the paint on the box so that the lid and bottom
plate are electrically connected, or you can "tweak" the microprocessor
crystal to a less annoying frequency with a gimmick capacitor. This is
a common complaint, and AEA's PK-232 has the same problem with painted
surfaces so don't blame MFJ too much. Look at it this way, you could
have a TNC with a *plastic* case. ARRGH!

You *are* using all shielded cables aren't you? You *have* decoupled the
power cord with a couple of .001s haven't you?

>as a side note has anyone connected a dj580 and an mfj1270 together.
>specifically what value of resistor do i need to activate the ptt line.

This is the circuit I recomend for "leaky PTT" style HTs. Check to see
that your dj580 is wired like Icom and Yaesu before wiring that end.

You can rip a suitable transformer out of an old transistor radio or
buy one from Radio Shack. Just heatshrink it into the cable.

Note2: Don't try to use your rubber ducky for packet. You'll get
RF feedback into the TNC through the cable. Use a remote antenna
and it'll work much better.

Gary

A new filter circuit called the "Bowtie Filter" will soon
be available for the PK232. It improves filter response and
provides maximum mark/space seperation.

It also improves the "crossed footballs" on a tunning oscilloscope
by displaying a + or bowtie pattern. By using the tuning scope
and a bowtie you can tune you radio within a couple of hertz of
a packet center frequency. The filter can also copy shifts as
low as 30 Hz and still maintain the (+) bowtie display.

I saw a prototype that was installed in an Infotech M8000 and
the o-scope display was impressive. I was able to tune the receiver
on a dead carrier and watch the o-scope display go from | to /
to - in 10 Hz steps.

The filters will be available from Willco Electronics P.O. box 788
New Lenox, IL 60451.

Sorry if this isn't the right place to post this, but since it is packet oriented, maybe somebody would like a complete working station..

Flames to /dev/null :-)

Complete station sellout. Some items are paired, others can be separated. No reasonable offer refused.

1. 486-33 64k cache, 8mb + brand new 245 meg IDE and refurb 130 meg IDE, WD8003e, ET4000 chipset video w/ 1meg, Wangtek 5099en with Wangtek PC-III controller. AST 4-port board w/16550a's, 1.2 and 1.44 floppies. Goldstar SVGA monitor, 1024x768, 1 year old. Asking $2000.00.

2. 286-10, 1meg, Dual 1.2's. Sigma Designs 19" LaserView monitor, 1660x1200, mono, with video card. WD8003e ethernet card and 40m Microscience Int'l Drive, 1:1 WD controller, 2s, 1p. Asking $600.00.

3. Boca v.32/v.32bis 14.4k External modem with FAX, 3 months old. Must be sold with 486 system, or if 486 goes first, then will split. $200.00

4. Icom IC-229-H, perfect condx, no problems, I bought it new. $280.00

5. Icom IC-228-A, excellent condition, also bought new. $250.00

6. MFJ 1270 and 1270b TNC's. $100.00 each. Firm. Prefer to sell with radios.

7. Astron RS-12 and RS-20 power supplies. Both in service, no problems.

$125.00 for RS-20, $50.00 for RS-12.

8. Systron Donner 13.8v @ 80A. Lab grade supply. In service now. $100.00
   That is a pickup item due to weight, unless you pay shipping. approx
   115 lbs.

9. Motorola Triton, VHF radio, converted to 2 meters, currently working as
   packet node. $100.00

10. IBM 6157-002 external 150 meg tape drive. New. $100.00. No controller
    card. QIC-02.

11. Wangtek 5099-EN, with PC-I controller card. $125.00.

Those are all the major items. Prices are "best guess" and may seem or
even be high for some. Have not kept up with radio/pwr supply prices.

Prepay with money order or Cashiers Check and I ship. Otherwise, you pay
shipping for COD. (All items except 80A supply). I guarantee all stuff
to be working when shipped, and working when you get it, barring Murphy.
I'll refund for DOA. Some computer equipment is still under warranty. I
can handle warranty, or provide invoices and you can do it.

I prefer e-mail on first contact, then telephone.

Hi all out there in netland I'm looking foe your input on High speed packet.
I'm in the Los Angeles area and have been diddling around in packet off and
on for a couple of years. My main objection is it's just too slow and crowded

in the Los Angeles at the pedestrian speed my AEA PK-232 goes. I've recently runinto couple of local posts about 9600 modems and need your input.

I am especially interested in the PacComm IPR-NB96 which is a G3RUH 9600 baud direct FM modem design. This particular product is a tnc+9600 baud modem+ a 2 watt 70 cm crystal controlled radio all in one package. The reason why I am interested in the whole package rather than a kit is I am lousy at electronic assembly and have yet to find an Elmer in the Los Angeles area willing to "edumacate" me on the finer points of electronic assembly and testing.

I would appreciate any feedback on PacComm produts, service, support, ect.. I would also appreciate any info on L.A. area 9600 systems and accessability.. and I know because of the network capability of packeteers that some of you EAST coast people may have a person in the Los Angeles area for me to contact. Thank you all in advance and 73 .. de KC6CAL

He hasn't answered his phone for the past 4 months, anyone know of another way to get an ip address?

I just tweaked the variable trimmer cap for the xtal to around 145.00.
That kept it away from more important freq that I use namely I hang
on 144.990. Adding extra caps wasn't nessasary since it had the var
cap ct4 I believe. Some tncs like the pk232 and pk88 don't have this
var cap then you have to do the cap routine or change the crystal
like someone else I know did. Then it puts the harmonic on 147.435
the atv talk freq hihi.

Can anyone out there help me with Fax/WEFAX with a MFJ-1278 and a macintosh.
I like the TNC for packet .... but can't find any software to copy faxes.

MFJ has been promising a macintosh version of Multicom (MFJ-1287B) for months (since before I bought the TNC) and the latest answer is always "we expect to ship in 4-6 weeks".... If I can't find a solution to this problem I guess I will have to sell the MFJ and get a KAM.... thanks Art Jeyes

Below, and two more messages are the BINHEX of a Stuffit file for PacketTracker for the Macintosh. This program watches packet activity and displays maps. The announcment about the program was last week.

The program is freeware, please post anywhere that is appropriate on archives etc.

PacketTracker V1.04
Part 1 of 3

(This file must be converted with BinHex 4.0)

Recently I was ftping from nic.funet.fi, and in one of the directorys on
there system was a file called KAM60.BIN in an eprom directory. Being as
it is exactly the size of a 27512, and the kam uses a 27512 I do presume
that it is an eprom for the kam. But what does it do? Who wrote it?
Where is the documentation? who has the source? why would I use it?

73,
stuart

OK, so here is the story.

I really am looking to enter the world of packet radio. I am certainly NOT
a radio broadcast and xmit-illiterate, but packet radio...

I have the ka9q package already, but need to know some things before
taking the next step along the long path:
- What exactly is the desired hardware in The Netherlands
- What frequencies are in use?
- Is there a regional coordinator for NL?
- Do I need special licenses?
- and, <blush> is this expensive?
- is there a way to get my usenet through packet radio?
- area there international links around the world?

So much questions, sorry if one or some questions are a FAQ. I do no think so,
because the latest FAQ doesn't seem to satisfy me :-)

Sorry for those who think 'o no, a newbie'. In a certain way I am, but I have
my experience and knowledge...:-)

Thanks in advance,

Rene. (please reply through netmail).

I put this file in the incoming directory of ucsd.edu yesterday. It
is called radio_config.sea.hqx.

May I suggest trying one of the satellites equipped with a store-and-forward
BBS - e.g. AO-16, LU-19, FO-20, UO-22, or KO-23? I suspect that most of
these islands will be relatively quiet in the RF spectrum, and you wont
be competing with many other stations in the footprint, so modest

stations (e.g. omni antennas) shoiuld work well, I think.

Only disadavnatga e is being near the equator, you mauy have just
a few decent passes weach day - but then. all you need is one or two
a day. Other disadvantage is the possible compleity of automating
the connection.

BTW, Volunteers in technical Assistance (VITA) does this all the time
on (the former amateur satellite) UO-14. It's exactly the kind of
situation you're facing.

Anyone with REAL experience (vs. my THEORETICAL and I read alot) on
the packet satellites care to comment?

OK I GIVE UP,

Well... it's not quite that bad....

But I have spent 2 weekends with lots of test gear (service monitor, scope
spectrum analyzer) and I can't get the a MFJ-1270B/Alinco DR-1200 to talk with
the same pair. Both have the MFJ-9600 baud modems. I am lucky enough to have
both systems on the bench next to each other.

The Alinco radio has been modified as per the recommendation of Alinco for 9600
baud operations. (They work just fine at 2400 baud).

The first problem is the deviation, the 9600 baud manual quotes that the modem
will produce 8 volts of audio. Well all three of the MFJ 9600's I have, start
clipping at less than half a volt!!! That equates to 1.8 kHz of deviation.....
any more and the waveform distorts seriously as viewed on the scope. (Why is
it so different than the manual quotes??)

I have been through all the jumper settings for the ROM waveforms. No luck.
The radios have individual coax's from the front connectors to the tnc's. Both
modems work just fine on loop-back.

Has anyone ever gotten this combination to work??

Thanks for the help..

N0ARY and I have been forwarding packet mail from our PBBSes running
under Berkeley-flavor Unix with great success.

Is there anyone out there who would like to join in the fun?

We are basically mailing import/export format multi-message mail files
to a specified address on the other guy's system.

I would be glad to share my bbs code with anyone, however it runs
properly only on Berkeley Unix derivatives. It will not completely
work on SYS V systems due to lack of networking.

Subject: Help getting Net_Mac (PA2AGA 2.3.15) installed
Date: Wed, 27 Jan 1993 09:19:34
Organization: CWRU School of Medicine
Lines: 24
Distribution: na
Message-ID: <ashok.296.0@biochemistry.cwru.edu>
NNTP-Posting-Host: axa12-slip.dialin.cwru.edu

Would someone please help be get Net_MAC installed. I picked up the most recent version from "ucsd.edu", that is supposed to work over MacTCP.

Installation seemed simple enough; it created a folder called Net_Mac Folder, and I created additional folders within the Net_Mac folder called "spool", and within "spool" I created "mqueue" and "mail".

When I try to run Net_Mac, I get an error about the dirnet.temp variable and the inability to find the folder "SCSI-1:Net_Mac folder:spool:mqueue", which very much exists. I tried moving the location of the "spool" folder (and folders under "spool"] but nothing seems to help.

Could someone please help be get this working?

Thanks,

Ashok

CORRECTED MESSAGE FOLLOWS

Can anyone out there help me with Fax/WEFAX with a MFJ- 1278 and a macintosh.
I like the TNC for packet .... but can't find any software to copy faxes.
MFJ has been promising a macintosh version of Multicom (MFJ-1287B) for months
(since before I bought the TNC) and the latest answer is always "we expect
to ship in 4-6 weeks".... If I can't find a solution to this
problem I guess I will have to sell the MFJ and get a KAM.... thanks Art Jeyes

Hi,

is there anybody using a C558 for PR ?

How can I connect a TNC, should I buy mono or stereo connectors ? How to
handle the PTT ??

pse EMail or post !
Thanks in advance,

I'm one of the adminstrators of a student run machine here at NMSU, due to the large number of engineering students here there has been a great deal of interest by our users in regards to a packet radio gateway to the internet. I have read the FAQ and I am under the conclusion that there are a number of legal questions involved with this gateway. Could someone out in netland let me know of a location that I can get the info or tell me what the technicalities might be and the possible cost. This is the first effort I've made to solicit information so feel free to include as much info as possible, pricing info on the hardware neccasery would be helpful also.

please respond to : rich@scf.nmsu.edu

Thanks,

Rich

I read the FAQ but that only gave an overview of TCP/IP. What I need to know
is this:

(a) Can I get software/hardware for my PK-232mbx & PC?
(b) Who do I need to ask to get allocated an address and be added to the
     name servers?
(c) Is it worth bothering with anything less than 9600 baud?

Thanks if you can help.

Ian.

Could someone please explain to me how the command

"ip access permit/deny/delete" works in Ka9Q NOS -- I have tried using it in
Pa0GRI 2.0, GRINOS (N1BEE 0.85b) and WG7J 1.07b, and clearly I do not
understand how it works.

I am trying to deny access to a single IP address port 110, but am unable to
do so.

    There is a missing file that provides the runtime environment and documentation for NET/Mac that has never been loaded to ucds.edu. I have contacted Adam PA2AGA about this and he will be uploading this file soon.
    In the meantime, you can get it from a SUMEX mirror site such as sumex.stanford.edu in /info-mac/comm/radio-config.hqx.

Good luck,

>Also is it difficult (or possible) to DX on 2m and 70cm using repeaters or
>satellites
>

It most certainly is, Jose! While I'm not a DX'er by any stretch
of the imagination, I do in fact enjoy collecting QSL cards from
DX stations that I've worked on the various Amateur Radio satellites.

In fact, I just received a card from HS1JC in Thailand for a Fuji-
OSCAR-20 contact that we had last month.

There's LOTS of DX on the satellites, and it's entirely possible
to work well over a hundred countries via the satellites now.

By the way, the ARRL has recently changed its VUCC program so that
satellite contacts are allowed. That makes the chasing of grid
squares on satellites an attractive and exciting aspect of Amateur
Radio operation.

Not a bunch. Which is what makes it even more exciting for a newcomer
with "only" a codeless Technician license, for example, and only a
few watts of power on two meter packet. He can still work the world,
and get one of what is presently a fairly rare certificate for his
efforts.

See Page 97 of the February issue of QSt. There standing in his
glory is Jussi, OH5LK, who would otherwise be a really FINE person,
except that he got the FIRST VUCC satellite award, with a
&*(*&^&&*& total of Five Hundred and Sixty One grid squares!!!!

Argh....

And I'm working on my 74th one so far...   Double Argh!

LH

Jose, the only difficulty might be that AO-13 tends to favor the Northern Hemisphere so it's a little harder to find times to work it from down under. But as Luck (one of my first OSCAR contacts) points out, there is a lot of DX on the birds. I'm also discovering that you can get up on Mode B without too great an investment if you have a 10 meter transmitter and receiver (or a transceiver and receiver). If you get up on AO-10 or AO-13, let me know as I still need to work VK!

Luck, I find it interesting that VUCC is available on satellites. I had heard about that change and in fact am working towards the new award, but find it a little strange. I have yet to work more than a couple of grids more than once. It's almost as though every contact adds a new grid for me. Have there been many satellite VUCC applications?

73,
Todd

Paul PJC130@psuvm.psu.edu writes about 56KB in Western Pa.

A group of hams in Ohio have been working on high speed links across Northern O
ho. Right now we have links from Poland OH (wb8lvp) to Brookfield (kb7yw) to th
e GeaugaSw.Ampr.Org. to the LakeSW.Ampr.org (wb8lyj-4) to the ClevSW.Ampr.Org (
kf8ph-4).

The Poland to Brookfield link is at 56KB, and they have been looking for access
 to Pittsburg. If you are interested, we have another station moving to NE of P
ittsburg who is interested in 56KB. Maybe we can all get togather before the B
utler Hamfest.

We have the equipment to upgrade the other stations in the backbone to 9600 bau
d, and will be starting on that soon, but we have a lot of interest in 56KB. In
 fact I am looking for someone in the Cleveland Area to do 56KB with as well.

Please let us know if you are interested.

Bob

I have had several requests for ftp of my bbs for Unix.

You will find it in ftp/pub/hambbs in the file "xobbs60.tar".

Hi:

 We here in New Orleans are running a 9600 BPS backbone on 446.100.. It
will soon be in Lafayette and than Lake Charles.. Sure would like to link
up to Houston some how..

Hi Bob,

 I am using the MFj-1270B with the MFJ G3RUH modem with my Alinco 1200 data
radio to connect to a Cluster high speed backbone network.. It works great
for me.. I am wondering the mod that Alinco suggested to you?? There were
several of them.

Hi, I am looking for a version of software that will allow
my spacr 1+ to talk to a tnc amd send either ax25 and/or
tcpip packets. We have something working on a vax, but now have
an oppurtunity to use a sun. The nice thing about this situation
is that I will be able to communicate easier during the day.
I would really like to get this on the air, any help would
be greatly appreciated. Ax.25 or tcpip will do. thanks.

Greetings,

One of my bbs users found a not quite complete hardcopy of a document he
described as "TCP/IP Users Guide for Beginners, V2.0, by N6GF". Does this
sound familiar to anyone and if so, where can I pull it off of the Internet?

Thanks in advance......

Folks,

Having gotten my feet wet with KA9Q in a DOS environment, for some unexplicable
reason I should like to have a go at a VAX version. Does such a thing exist?

Any pointers / helpful suggestions welcomed.

>(a) Can I get software/hardware for my PK-232mbx & PC?
>(b) Who do I need to ask to get allocated an address and be added to the
>   name servers?
>(c) Is it worth bothering with anything less than 9600 baud?

(a) the PK-232mbx is tcp ready... all you need to do is put it in KISS
mode. For the PC, there are several flavors of the ka9q "NOS" program.
If you have FTP access, try the hamradio/packet/tcpip directory at
ucsd.edu -- that's the main repository. Several versions are also
available from other bbs's, etc. The most actively developing version
at the moment is "JNOS", developed by WG7J -- it adds full pbbs
functionality, and a lot of other bug fixes, etc. KA9Q also is still
developing the base code upon which others build. I've also heard that
the PA0GRI 2.0m version is quite stable.

(b) Not sure who the UK coordinator is.

(c) Yes, 1200 baud does work, and that's still where most of the
activity is. But having recently gotten involved with a 19.2kB network,
I can say that the higher speed makes it a lot more fun!!!

Plug time: I've written a document that pretends to be a complete
introduction for new tcp/ip users. It's about 35 pages, includes sample
configuration files, and is NOT a rehash of the reference manual for the
software. It's available as "intronos.zip" from ucsd.edu (in the
tcpip/docs directory) and is also on several bbs' as well. It's
available from compuserve under a slightly different name; search for my
name or call in the packet radio library to find it, as I can't recall
the silly name they used.

Greg, I've seen several answers to your questions, and i have been a happy
user of Kantronics for 2 years now. Basically to answer your questions, u have
to first decide what u want to do. Do you really want and need an "all Mode"?
Or do u just need packet for the time being. If you want all mode, then do
you use a PacketCluster? If so, the KAM is the only one that will allow u
to run VHF packet, while you type your heart away on RTTY, AMTOR, PACTOR!, or
CW and ASCII. Also, Jay has mentioned the fact of the 232
's host mode as being great, i do hope it is better then Kantronics. I have
seen a few things about the Kantronics host mode that i wish could be changed,
but one also must remember, it still is the only (affordable) true dual port
tu out. It also is currently the only one of the three u have mentioned that
has the pactor eprom as well!

So basically what you need to do is decide what you really want! But i WILL
recommend the Kantronics!
Good Luck!
Charlie KI5XP
cfm1471@usl.edu
BTW: The KAM costs slightly more then the 1278, but is less then the 232!

>
>73,
>stuart
Stuart, *IF* in fact it is the 6.0 eprom for the kam, its the Pactor
upgrade. It has all the same packet upgrades as the 5.0, 5.01, and 5.02
does, but it adds the Pactor mode for the HF port. If u buy it from Kantronics
they also include the Hostmaster 2 Plus program *UPGRADE*, not the program
mind u, but an upgrade that is SPECIFICALLY mated with the eprom. In other
words, with the eprom and any terminal program, u will still be able to run
pactor, but with the correct eprom and copy of hm2plus, you will be able to use
the pactor drop-down menu on the prog.
Hope this helps some.

Help! I have upgraded from version 1.04 of WG7J NOS, to 1.07b, but I can't for

the life of me get my rewrite file to work. It never had to take mail fro outside the local BBS, but now, I want it to. Everytime I try and send some mail outward, REWRITE ends up deleting the TO: address, presumably from the rewrite scans. I am trying to send mail to the normal AX.25 world, but not through a gateway. Is there any way to do this? If I have to, I will become the AX.25 <-> SMTP gateway.

Sorry if this is a stupid question, I don't have a lot of experience with packet TCP/IP...

Does anyone know of a way to get FBB to send a blank line after connecting to a TCP/IP station? Our local board forwards user mail to PBBS's. The only problem is after connecting to my station, AmigaNOS will not send the prompt until it receives a blank line. I don't have a jumpstart command like JNOS (any chance of this in the next version Mr. Heaton?) so I need that blank line. The sysop doesn't think its possible so I'm throwing it out to the net for suggestions.

Thanks Steve

Good morning. It's Sunday the 31st of January and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- The February RadCom has been posted; we have an important message for RSGB Morse Test candidates; and some repeater news.

The February edition of Radio Communication has been posted to all RSGB members. It includes a message from the 1993 President, Peter Chadwick, G3RZP. On page 18 full details are given of the RSGB VHF Convention which takes place on Saturday the 6th of March at Sandown Park, Esher.

Now a reminder to all Morse Test Candidates from Roy Clayton, G4SSH, Chief Morse Examiner: Would all Morse test candidates please note that as from the 1st of January 1993 it became a requirement by the Radiocommunications Agency that two recent passport-sized photographs must be produced at the time of the examination. The September 1992 edition of RadCom gives the details. The requirements state that failure to produce these photographs for identification will result in the candidate not being allowed to take the Morse test. Candidates no longer need to produce written proof of identity, such as a passport or driving licence.

A new UHF voice repeater GB3TL became operational on channel RB14 from its site near Spalding last Sunday the 24th of January. GB3TL is operated by the Spalding and District Repeater Group. Details from G7JBA.

Next a message from the Arfon Repeater Group which looks after GB3AR and GB3AN

Repeaters. There is a project to link GB3AR on 145MHz and GB3AN on 433MHz. The work is at an advanced stage and experimentation will take place to finalise the project, which will possibly involve some disruption in service for the next few weeks. Users are asked to be patient until the project is fully operational, when full details will be released.

The GB2RS main news bulletin has been available for a week on a telephone line and it has proved highly popular. The experimental service is updated each Thursday evening and will normally be available to callers in advance of the regular Sunday broadcasts. The bulletin is accessed by calling 0336 407394 which is a premium line charged at 36 pence per minute at cheap rate and 48 pence per minute at all other times. Some of the proceeds will go to the RSGB. From last Thursday, the 28th of January, all Potters Bar five-digit telephone

numbers had a six added the beginning of the existing numbers. This affects all RSGB HQ lines, including the general enquiry number which will become 0707 659015.

News now of the appointment of an acting RSGB Liaison Officer (RLO) for Hampshire. He is John Irwin, G4XJT, and his address is 5 The Thicket, Fareham, Hampshire, PO16 8PX. His telephone number is 0329 827051. RLOs hold a wide range of information and should be used by RSGB members seeking advice.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Ascension Island, G4ZVJ will be active again as ZD8VJ from now until January 1994. From Aruba, K4PI will sign P40PI until the end of January and will take part in the CQ World Wide 160 Metre CW contest. From the Seychelles, F1FIC will sign S79MD for the next two years. From the British Virgin Islands, W2GUP will sign VP2V/W2GUP from now until early March on CW only, mainly on the WARC Bands. From the Maldives, DK6AS will sign as 8Q7XX until today Sunday the 31st on all bands, using CW only. Check 5 and 25KHz up from band edge.

Rally news:

We know of no rally scheduled for this weekend, the 30th and 31st and only one for next weekend, On Sunday the 7th of February, the South Essex Amateur Radio Society's Radio Rally is to be held at the Paddocks, Long Road, Canvey Island. It can be found at the end of the A130 road. Doors open at 1000am. There will be the usual trade stands, bring and buy stall, home-made refreshments. Free car parking, with parking outside main door for disabled visitors. Talk-in to be on channel S22. Further details can be obtained from Ken Hendry, G0BBN by telephoning 0268 755350

Next some HF Contest news:

The CQ World Wide 160 Metre DX contest takes place this weekend. It started at 2200 on Friday the 29th, and ends at 1600 today, Sunday the 31st. Further details can be found on page 12 of January's RadCom. The RSGB LF Cumulative Contest sessions take place as follows: The 7MHz event is today, Sunday the 31st, from 1000 to 1200GMT. The 1.8MHz event is scheduled for Friday the 5th of February, from 2000 to 2200GMT. And the 3.5MHz session is on Sunday the 7th

of February, from 1600 to 1800GMT. For further details see page 62 of December's edition of Radio Communication.

Now the VHF Contest news:

The second of five 70MHz Cumulative Contests is today Sunday the 31st, from 1000 to 1200GMT. The next one is scheduled for Sunday the 21st of February. The RSGB 432MHz Fixed, AFS and SWL Contest will take place next Sunday the 7th of February from 0900 to 1500GMT. For further details of these events, see December's RadCom page 61.

And now the solar factual data

The period 18th to 24th January, with the quieter side of the sun coming into view, saw a massive decline in sun spot levels and a continuing decline in solar flux and X Ray flux levels. Geomagnetic activity has been up to sub storm levels in northern latitudes. No flares of any note have been reported this week, but a sudden storm commencement occurred on the 19th with high levels of magnetic activity. Sunspot numbers declined every day and were only 33 on the 24th, the lowest level since last June. The period meaned about a spot count of 65. Solar flux levels also declined from 122 units down to 107, over the period and averaged 110 units. The X Ray flux also declined every day and only averaged B1.5 units over the period, with the 24th being down to only B1.1 units. This is the lowest level since last November. The geomagnetic activity ranged from a substorm level of Ap index of 30 units on the 19th down to the quiet level of only 3 units by the 23rd. Most activity was reported in the higher latitudes. Levels averaged 11.7 units for the period. The state has been nil, nothing to report, throughout the period except for the mag storm on the 19th. The radio quality indices declined every day dropping from just above normal to slightly below by the 24th. The northern circuit Stavanger, dropped to extremely poor by the 23rd, due to the magnetic activity, but was recovering by the 24th. By contrast, Canberra has been up to well above normal particularly on the 20th. The aa indices as supplied by the British Geological Survey for the period 12th to 18th January were mainly quiet with the daily averages being 25 nanoTeslas, about K3. There was little day to day variation.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, averaged 9.3MHz with levels declining over the period from 10.2 down to 8.9MHz. The darkness hour lows averaged 2.9MHz with little variation day to day.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 8.7MHz with the darkness hour lows being 2.6MHz. Solar flux as we have known it for many years is measured at 2800MHz, this frequency was used simply because the radio sun looked the same size as the visible sun, it had no more merits. With satellites sending back more sophisticated data in real time, solar flux has taken on a new look. It now starts at the X ray band at 0.5 Angstrom units up to 8.0 Angstrom units. This is averaged every 5 minutes and again averaged for

each day, giving a back ground flux level that is much more sensitive than just the one reading per day at 20.00 hours UTC of the 2800MHz flux. It is probably only a matter of time before the X ray data will become the world standard.

And lastly the solar forecast:

This week, the more active side of the sun will be coming into view, and solar flux levels are expected to be about the 110s. Geomagnetic levels are expected to be just unsettled due to the passage of some coronal holes. HF radio conditions are expected to be normal this week.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S Z and G7 N Y series, and Novice calls in the 2 0 A E and 2 1 B J series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

I am running NOS (the version from the first week in January) with a BayPac TNC and the AX25.COM packet driver and I am just doing plain AX25 for now.

1) When someone tries to connect to me, the only indication I get is that I see the connect request go by in the trace buffer. There has GOT to be a better way. Is there some way I can have it tell me that someone is trying to connect to me?

2) An opinion question: I have seen 87 flavors on NOS floating around in the Ether (JNOS, GRINOS, etc.). I realize that these are all enhancements on the

baseline of NOS, but, which flavor do people recommend?

3) With this 'latest' version of NOS I have noticed that F8 doesn't always switch screens. It has logically switched, because if I hit it again I get the next one after that, but, it just didn't seem to repaint the screen. I would say that the failure rate is maybe 1 in 10 (guessing). Am I the only person who has had this problem?

4) And, if I blow it typing the connect command and end up trying to connect to a non-existant node, the disconnect command has no effect (because I am not connected?). How do I abort a connect request?

Thanks.

As a new ham who isn't into packet yet (can't afford a TNC), I'm looking for help finding an old friend. He's somewhere in California, call is KC6BPH (Mark). I'm hoping to use the Internet<->Packet gateway to send email and touch base with him. He was pretty heavily into packet before he moved a few years ago, not sure if he's still into it.

Any help on finding a path to him would be most appreciated. Email or posting is fine, as I'm reading this newsgroup to wet my appetite for packet.

-ks

Hi....I've been using KA9Q on an MSDOS system with an SLFP
driver for several years now. I recently got a package called
QVT for Windows that is suppose to be able to work with the same
packet drivers. After endless futzing around with the ".RC" file
(sort of equivalent to AUTOEXEC.NET for KA9Q, I guess), I *STILL*
can't get it to work.

Just for info: I'm running DOS 5.0, Windows 3.1, and SLFP 1.23.
Normally, I dial into a public MichNet port with the SLFP driver
and am assigned an IP address from a pool. From there, I'm in
business. With QVT, I have to dial into the MichNet port and
setup an SLFP session manually. Then, I exit the comm program
without hanging up, run the SLIP driver (I've been using the new
version of KA9Q - 930118 - withthe SLFP dialup module and KA9Q
interface setup as encap SLIP), run the PKTINT driver, andthen
start Windows.

If some kind soul could give me some hints about how to get the
SLFP/SLIP driver to work with QVT, I'd really appreciate it!
Something that would allow me to convert the settings in my
AUTOEXEC.NET file for KA9Q into something meaningful for QVT's
RC file would be great beyond belief!

Please e-mail all responses to at887@cleveland.freenet.edu.

Thanx!
Scott

Which NOS to use depends on many things. Do you want to operate a full
service bbs? Are you only interested in being an end system on an existing
network? What are the people you are going to communicate with directly
using? Are you a person who likes to create or modify programs?

IMHO JNOS is the way to go if you want (or think you will want) to run a bbs.
I tried a half dozen of the others and use JNOS on my bbs. JNOS has the best
interactive development group around. Updates are frequent, people who ask
for new features either get them, are convinced to reconsider or assisted in
their own effort. All the sources are available and beta testing is
encouraged.

WNOS has a decent reputation for end system users. It has a nicer screen
interface than JNOS but does not have as good a support system. I do not like
the fact that is automaticly finds and changes routes and I found it easier
to distribute an end system version of JNOS in my subnet. My local users have
found it more stable and are happier with JNOS. We also had trouble finding
sources for WNOS and could not get it to run on XT systems.

TNOS is a yet to be released version on NOS. While it has made a great promise
I have not seen it yet and it is thus far a one man show. Unless this evolves
into an open support and development environment like JNOS it will ultimately
fail as many others have.

Mind you, you know what they say about opinions......

I have a PacComm Handipacket with readymade
radio cable attached to my Icom W2A HT.

On transmit, often the xmit light lights on the
TNC but the PTT is not activated on the HT,
or just flickers on. Sometimes it works
just fine.

Normally I would say that the minijack
connection to the radio jack has become
intermittent as minijacks are wont
to do over time, but my HM65 speaker mike
has *never* had a problem transmitting.

Now I suspect RFI or some other wiring problem.

Any insight or similar problem?

Thnks.

Does anyone know for sure what was changed in BPQ406A from 406? I have
had problems with a PC running 406 running NETROM protocol out the
serial port and talking via a diode matrix to a Data Engine running
DE406. Specifically, it appears that the PC is not recovering whenever
the Data Engine sents a choke frame. Additonally, the BPQ in the PC
seems to randomly set RTS and thus lockup the whole matrix until a
hard reset is initiated.

Running BPQ405 with zero handshaking stops the lockups and the weirdness
with the Data Engine, but that's obviously not the way to go. I got
a message from a ham that stated that he THOUGHT that 406a (which appears
to consist only of a new configuration binary) was designed to solve
this problem. While I found 406A at ucsd.edu and got (get?) it, I can
find no documentation on what it was for, or why it exists.. any help
would be appreciated from someone in the know.

The following items were used to contract a computer controlled
robot as a high school science fair project. They are all in
working condition, unless otherwise noted. They should be ideal
for anyone who wished to construct a computer controller; such
as a computer house alarm system or a HAM radio "shack" controller.

1 Micro R&D, INC. MAW611 I/O $100

This is a general purpose input and output
board designed for the commodore 64. It
plugs into the cartridge port and provides
16 analog inputs, 16 discrete output, 1
analog output, and is socketted for user
designed firmware (an EPROM socket). When
a user coded EPROM is plugged into the board,
this code is run every time the computer
is turned on. The board cost $300 new.

Manual & Software & I/O hardware

2 C64 Centronics Printer Adapter $10

Allows a commodore 64, vic 20, or 128 to
use standard centronics parallel printers.

Adapter Hardware

3 C64 - With a detachable $75

This Commodore 64 has a detachable keyboard,
a hack performed by me. This Motherboard was
inside my robot. To readily type on the
system, I connected a 5 foot ribbon cable

from the 64 to its keyboard, which is housed in a separate C64 case (minus the PCB).

C64 Motherboard & Detachable Keyboard

4 VIC 1541 Disk Drive $75

Original disk drive for the 20, 64, 128 systems. Works, but needs alignment.

Diskdrive & Manual

5 Comm Data Director $75

This device allow up to 8 V20/C64/C128 computers to share one line a perifials (Printers, disks, etc). Up to 8 computers are plugged into this electronic director (multiplexer) along with the shared perifials. The director automatically serves the requesting computer by auto-matically connecting it to the requested perifial (completely transparent and automatic).

Director Hardware

6 Numeric Keypad (Broken) $1

C64 external keyboard. Some keys work and some don't. This unit is disassembled, but comes with all parts.

Disassembled Keypad Hardware

7 CBM C2n Cassette $10

Original Data Cassette for the V20/C64/C128

Tape Drive Hardware

8 Voice Command Module $75

This device plugs into the expansion port of the C64 (port where CBM modems are placed) and allows the C64 to digitize and recognize speech.

Hardware, Manual, Disk

9 (New) C64-Cartridge Extender $15

This is a ribbon cable and connectors for allowing cartridges (and other devices, such as the I/O board - device #1 above) to be placed away from the C64 units. Should also work with a 128

Ribbon Connector Cable.

TOTAL OF ALL ABOVE ITEMS	$440

NOTE:

Since the drive need alignment, I have no way of testing the software that come with the above hardware. They did work a few years ago, when this system was in use.

I would be nice if I could sale these items together. As an incentive, I will take $300 for them all and will ship any where in the US.

Offers will be entertained. Thank you.

Roy Sutton P.O. Box 361 (409) 857-2483
Prairie View, Texas
77446-0361

---

1 ECE Midi Interface $25

Commodore Amiga Midi Interface. Has three ports, in, out, thru. It also passes the Amiga serial port through so that other serial devices can be left plugged in.

Roy Sutton P.O. Box 361 (409) 857-2483
Prairie View, Texas
77446-0361

---

1 (New) WP Library $25

New copy. Its was sold to me by Word Perfect when I was an Amiga salesperson at a discounted

rate, and is marked to indicate so. It has
been upgraded to the most recent version (before
the scoped development)

Roy Sutton P.O. Box 361 (409) 857-2483
Prairie View, Texas
77446-0361

---

1 Logitech 3 button Mouse $25

Very nice Mouse for the Amiga. Its been my
favorite for the last three years. I've
upgraded to a sun m3 (hacked) mouse. This
mouse is in new condition, rolls very
smoothly, and has excellent "click" switch
buttons. Comes with required adapter cable
for Amiga.

2 Mouse Pad $1

Free with purchase of Mouse

I would like to organize a temporary wireless access site to the internet.
After examining some of the NOS software, it seems like it may be possible.
I am just asking for advice on how I might be able to accomplish this, and
any info if anyone has accomplished something similar.

I have at my disposal, 2 pc's. One has a physical ethernet connection to our local net here at ucla. It has a 3Com 3c501 ethernet card. I need this to be my gateway to the internet. This local network is connected to the Internet and thus I should not have a problem. I have already gotten recent Cynwyr drivers for this card.

The second pc will have a Spread Spectrum link to the first. For testing purposes, I want to use a SLIP connection for now. I must be able to initiate, from the second pc, a telnet session to a UNIX workstation, and remotely run files on the workstation.

If anyone has any experience which might help, could you please email me at

nazareth@janet.ucla.edu

I would also like any info about just connecting 1 pc using the 3com card to the network using the nos software, and info on the limitations of this setup.

Thanks,

Sean

I don't see anything in the help for Net/Mac about POP. Does it exist for the Mac?

Or would I have to leave my Mac on all the time and use smtp?

Is there anywhere on-line that I can find a description of the TAPR
9600 baud modems?? Can anyone tell me what they cost and if it is
likely that they would work with a RAMSEY 2 meter transciever??

     Sorry, but there is no POP client or server available for NET/Mac. You
will have to just use the SMTP support that it has.

Better yet, contact ICOM directly for this information. They faxed me the
correct schematic and recommended parts list before I could even hang the
phone up. The schematic recommends use of a resistor and capacitor, values
of which I have don't have with me.

This works fine for my packet set-up.

The ICOM's office number I called was (206) 454-7619, though sometimes you
may have to wait a while for a technician to answer.

Bob,

Heather Johnson said you wanted information on TAPR. Here is a copy of a
file we mail out to people who inquire. Hopefully, I will get a file server
going one of these days, but I think this will get the information to you in
good shape. If it comes out garbled, or you need any further information,
please contact me at rnielsen@tapr.ampr.org or 0060880@ccmail.emis.hac.com.

TAPR - What is it?

At the October 29th, 1981 meeting of the Tucson Chapter of the IEEE Computer Society the discussion turned to the then current state of the art in amateur packet radio. A week later six of the attendees gathered and discussed the feasibility of developing a Terminal Node Controller that would be complete and available to amateurs at a modest cost. This was the genesis of Tucson Amateur Packet Radio.

Their discussion led them to believe that a complete TNC, including modem and power supply, could be made available to the amateur community for approximately $125. They decided to go ahead with the project. On June 26th 1982 Lyle Johnson, WA7GXD, initiated the first TAPR built packet contact with Den Connors, KD2S.

As word of the Tucson based packet radio development effort spread around the country other pioneer oriented amateurs asked to be involved. By fall of the same year a total of 174 amateurs had committed to the project as beta testers. Evolving from their efforts was the TAPR Terminal Node Controller (now known as the TNC-1). TAPR, now formally incorporated but still manned entirely by volunteers, then made the TNC available to amateurs worldwide in kit form. Concurrently the nucleus of dedicated packeteers hit the road to demonstrate and introduce packet radio at club meetings and hamfests.

The new mode met with encouraging acceptance. The TAPR folks, now buoyed by their successful introduction of packet radio, decided to refine and improve upon their initial TNC. The product of TAPR's second development effort is now known as the TAPR TNC-2. Most TNCs now in use trace their heritage to the TAPR TNC-2.

Today TAPR continues as a membership supported non-profit research and development amateur organization. Development work is entirely by volunteers. TAPR currently has more than 1000 members, world-wide. A

membership meeting is held annually in Tucson.

Membership in TAPR includes a subscription to Packet Status Register, the quarterly newsletter. PSR has been published since July 1982 and is recognized as an authoritative source for up-to-date user and technical information on packet radio. Much of the material in PSR is timeless. Back issues may be obtained from the TAPR office.

Although TAPR has licensed several commercial manufacturers to produce TNCs based on the TNC-2 design, and the complete kits are no longer available from TAPR, we do offer the TNC-2 printed circuit boards (along with a schematic diagram plus EPROM code and assembly and operation manuals on disk) for those who wish to build their own and continue to supply several products in kit form, as well as a library of many packet radio software programs for MS-DOS computers.

The dues for membership in TAPR are $15 for one year. In Canada and Mexico dues are $18 and outside North America they are $25.

DESCRIPTIONS OF PACKET RADIO KITS AVAILABLE

TAPR PSK Modem

The TAPR PSK modem kit is designed for use with FUJI/OSCAR 12, the Microsats and JAS-1B as well as linear satellite transponder operation through OSCARs 10 and 13. In addition, it is suitable for weak-signal work on terrestrial paths.

The kit consists of three (3) printed circuit boards and all parts to populate them. It also includes cabling, connectors, LEDs, bargraph displays and switches to complete the modem. It does not include a case or power supply (it runs on 11-16 VDC). A case is available separately.

The modem requires the transmit data and a x16 or x32 clock from the TNC; it supplies RX data, RX clock and DCD to the TNC. A front panel switch bypasses the PSK modem and restores normal operation to the TNC, including radio connections.

Any TNC-1 or clone (Heathkit HD-4040, AEA PKT-1) or TNC-2 or clone (AEA PK-80, GLB TNC-2A,

PacComm TNC-200, MFJ 1270/1274/1278) will interface with no problems. The PK-232 will interface easily with TAPR's modem disconnect upgrade kit. Other units may interface but have not been reported to TAPR. Units with software HDLC may not interface (GLB PK-1 series, Kantronics KPC-series and KAM for example).

The PSK modem has been tested with Kenwood, ICOM and Yaesu radios. Proper doppler shift correction tracking with ICOM units may require a simple modification to the PSK modem which is documented in the modems instruction manual.

The TAPR PSK modem utilizes a Costas loop demodulator which has a 3 to 8 dB better performance than designs which limit the signal at the input stage. It has been extensively tested and optimized for 1200 bps operation. Other speeds are possible with changes to the input filters, but these changes are untested and undocumented.

Manchester (for satellites) as well as normal PSK transmit modes are available at the flip of a front panel switch. Doppler correction polarity (and defeat) is also switch selectable.

Front panel indicators include a LOCK LED (indicating lock to an incoming signal), signal strength bargraph and center tuning moving-dot display.

Construction requires a fine-tip soldering iron, a steady hand, two or three quiet evenings and access to a calibrated oscilloscope. A function generator or calibrated audio tone source and a Digital Volt Meter are useful but not mandatory.

Note:The PSK modem is not designed for recovery of the 400 bps non-HDLC telemetry transmissions from OSCARs 10 and 13. These transmissions are not compatible with standard packet TNCs.

TAPR 9600 BPS MODEM KIT

The TAPR 9600 bps modem is a full-duplex baseband modem compatible with the K9NG and G3RUH standards. Like these modems, it requires an interface to your radio other than via the microphone and speaker jacks. It has a 20-pin modem disconnect header which will allow a second external modem (such as the TAPR PSK modem) to optionally be connected. The 9600 bps modem

will fit internally into the case of many TNCs.

It uses a 4-layer PC board for minimum noise, utilizes a transmit waveform lookup table in ROM for minimum transmit distortion, and interfaces easily to a variety of TNCs. The transmit path includes an independent watchdog timer.

The modem selection logic correctly routes the PTT command from the TNC to prevent, for example, keying your 1200 baud radio when running 9600 bps.

The receive filter includes a compensation adjustment to tailor the modem to the radio receiver and AC-coupling to accommodate frequency drift on the channel. An improved state machine is used for clock recovery and a DCD circuit that is based on both signal quality and the presence of a signal.

It optionally includes a self-contained clock. A bit regenerator option is available for incorporating the modem into a full-duplex repeater.

PK232 MODEM DISCONNECT UPGRADE

This kit is a simple PC board assembly you can build in an evening and still have time left to operate your radio! Once completed, it simply plugs into an IC socket inside the PK232 and provides you with a "Standard" TAPR modem disconnect header (for plugging in the TAPR 9600 bps modem or PSK modem, for example) as well as a convenient place to connect the DCD State Machine upgrade kit. The result is a no-holes enhancement of your PK-232 (or Heath HK-232).

PK232MBX Installation Kit

This kit allows the owner of a PK232MBX with the "new" motherboard to install the TAPR 9600 bps modem with complete ease.

The kit consists of metal spacers and screws to mount the modem by picking up existing motherboard mounting studs inside the PK232MBX and includes a pre-wired harness to connect the 9600 bps modem to the TAPR PK232 Modem Disconnect Kit. The harness simply plugs into the 9600 bps modem at one end and the modem disconnect at the other end.

Finally, it includes a pre-wired harness that wires the modem radio port to the PK232MBX external modem port,

and the control and power connections between the PK232MBX motherboard and the 9600 bps modem.

Thus, modem installation becomes a simple "plug and play" operation, with no wiring harnesses to fabricate, no hardware to locate and no holes to drill!

NOTE: Owners of earlier PK232s with the MBX daughtercard may use the installation kit, but the prewired harness for the radio interface, power and control wires will not be compatible. These cables must be fabricated and will involve some minor work on the motherboard itself.

TNC-2 PRINTED CIRCUIT BOARD

Although TAPR has licensed the TNC-2 design to several commercial manufacturers and is no longer producing complete kits, there have been many requests for the bare printed circuit boards used in the TNC-2 by those who would like to "build their own". If operation exclusively with an external modem (such as the TAPR 9600 bps modem) is desired, it is not necessary to wire the internal 1200 bps modem portion of the board. Additionally, there are hams in many countries who have difficulty in obtaining equipment at affordable prices, but have access to parts and have expressed interest in building inexpensive TNCs. To meet these needs, TAPR is offering the TNC-2 printed circuit boards with a 5.25 in. MS-DOS format disk containing assembly and operational information and EPROM code, plus a printed schematic diagram.

METCON

METCON is a device for remote teleMETry and CONtrol. It is based on an 87C51 microcontroller and provides eight (8) inputs and eight (8) outputs.

The inputs can be used for digital monitoring (switch closures, etc.), frequency measurement (up to a few kilohertz) and pulse counting (drops from a rain gauge, etc.).

Four of the outputs are "dry-contacts" provided by normally open reed relays. They are suitable for controlling a variety of loads and can be used to energize larger relays for power control functions. Additional output relays and their connectors are available from TAPR.

METCON includes a serial port and three (3) levels of security access. It can be connected to a TNC at a remote site and, via a shared packet-radio channel, may measure and/or control operations at the remote site. Applications that come to mind include repeater control and weather observations.

An accessory voltage-to-frequency convertor is available to convert analog signals (voltage, current, power, etc.) to a frequency in the range that METCON can read. A slightly different version of this contains a temperature sensor which allows temperature to be measured by METCON.

An 8-input ADC module is also available for voltage measurements. This does not use any of the existing eight inputs, but unlike the voltage-to-frequency converter, it shares a common ground with METCON and is therefore unsuitable for measurements where ground must be at different levels or separated from METCON by long cables.

An elapsed time pulser is available as well. This is useful for measuring things like the number of hours a transmitter has been keyed up, or how long a cooling system has been running.

THE TAPR "DCD MODS"

Background

Proper operation of Data Carrier Detect (DCD) is imperative for efficient sharing of a packet channel. Many TNCs don't provide optimum DCD operation, and the current version (2.0) of AX.25 Level 2 protocol compounds the problem. However, an inexpensive solution is now available to combat the former case and progress is being made in the latter case with proposed changes to AX.25 Level 2 Version 2.1.

The Problem

The Tucson LAN operates via a mountaintop repeater dedicated for packet use. With a radius of coverage approaching 200 miles, it is essential that all stations be able to properly detect use of the channel by other stations and defer their transmissions until the channel is clear.

Over time, it has become apparent that most modems are lacking in proper DCD operation. Some are much worse than others. Some are OK, but allow improper operator adjustment without letting the "threshold" adjustment is incorrect. (TNC-2 code releases 1.1.6 and later alert the operator by not passing along packets that are received if DCD was not activated. This encourages the operator to properly set any DCD threshold control that may be on his TNC.)

Eric Gustafson, N7CL, has done extensive investigation into this problem and presented his findings at the 7th ARRL Computer Networking Conference. It has also been published in Packet Status Register.

Solution

If the DCD decision could be made on the basis of "information coherence" rather than "is their some sort of signal or noise present?", LAN operation will improve. This premise has been demonstrated in a number of locations where modifications to TNCs have been made.

Unfortunately, the modifications involve wire-wrapping a fair bit of circuitry, and this has prevented widespread adoption of the mods.

The TAPR Board of Directors approved funding a project in early January of 1989 to provide inexpensive kits to make it a trivial matter to upgrade most TNCs to improved DCD operation. These mods are extremely useful for both VHF and HF operation.

THE 2211 DCD UPGRADE

For TNCs using the XR2211 demodulator such as:

TAPR Beta Board	GLB PK-1
TNC-1	GLB TNC-2A
TNC-2	PacComm TNC-200
Heath HD-4040	MFJ 1270
AEA PKT-1	MFJ 1274
AEA PK-80	DRSI HF*MODEM

The PC board is tiny and shaped to fit into a TNC-1 or TNC-2. After construction (an hour or so), you simply unplug the XR2211 chip from its socket, insert it into the socket on the upgrade board, then plug the upgrade board into the IC socket vacated by the XR2211 chip on the TNC.

If you are into HF operation, provision is made to connect a "Threshold" control onto the demodulator.

The result will be fast-attack, slow decay DCD with a hang time to compensate for temporary fades due to multipath. When all stations sharing a channel have proper DCD action, data flows more efficiently.

THE STATE MACHINE DCD UPGRADE

For TNCs with modems such as:

KPC-1	PacComm Tiny-2/Micro-2
KPC-4	DRSI PC*PA Type 1
KPC-2400	DRSI PC*PA Type 2
KAM	AIWA APX-25
AEA PK-87	AIWA APX-25M
AEA PK-88	TASCO TNC-20
AEA PK-232	TASCO TNC-20H
PacComm TNC-220	Heath HK-232
Heath Pocket Packet	

The upgrade adaptor for these TNCs adds an EPROM-based State Machine to derive DCD based on lockup of a digital phase-lock loop. It is a small PC board assembly that mounts easily inside the cabinet of most any TNC (NOT the Heath Pocket Packet/TASCO TNC-u21).

This upgrade will dramatically improve DCD operation, allowing you to run your radio unsquelched. This alone reduces other station's TXDelay requirements, improving channel throughput.

For TNCs with "software HDLC," a optional clock generator may be included to provide the necessary clock signal (KPC-1, KPC-2, HF channel of KAM).

Can anyone recommend a good book or two (or other source of info) about packet.
I would like a good introduction/overview and some more details and technical
information. For example: I would like to know the details of the AX.25
protocol.

---

14 January 1993

On Saturday, February 13th, the TwinsLAN Amateur Radio Club will sponsor Midwest Digital Conference '93 from Noon until 8 PM at the West River Point Business Center near downtown Minneapolis. This is the same day as the Midwinter Madness Hamfest so plan on attending the hamfest in the morning - and the Digital Conference in the afternoon and evening.

Emphasis for this second annual conference has been expanded to include all forms of digital communications: Packet; RTTY; AMTOR/APLINK; PACTOR and CLOVER. There will be plenty of information-packed sessions for both digital communications beginners and experts.

Sessions will cover topics such as:
Beginning Packet; Wide-Area-Networks; Tri-LINK; local services such as Metro-NET, CHAT nodes, and DX Clusters; PACTOR; Digital Signal Processing; AMTOR and APLINK; TCP/IP; Satellite Gateways; and Future Software. Some nationally reknowned speakers like Karl Medcalf (Kantronics) will appear in person, others such as Joe Kasser (Lan-Link author) will make their presentations by teleconference - plus many local experts will be sharing their knowledge.

A superb dinner will be served from 5 to 6 PM - and will allow time to socialize with fellow packeteers from all over the Midwest. The dinner will conclude with a drawing for many valuable prizes. After dinner a SYSOP/NETOPS forum with ARRL Dakota Division Director Howard Mark as moderator will take place to allow sharing common concerns. The final activity of the conference will be a panel discussion to wrap-up the various topics presented during the day. Throughout the conference, a software swap table will feature the latest shareware and public domain software.

Special reduced-price tickets are available for registrations made prior to the day of the conference. Only a limited quantity of tickets will be available at the Hamfest and at the conference door. For more information contact Paul Ramey, WG0G, 16266 Finland Avenue, Rosemount, MN 55068 or call (612) 432-1640 between 6 and 10 PM weekdays and 10 AM to 9 PM weekends.

I'd like to try 9600 bps packet and would appreciate some advice on which
modems and radios to consider. The local (Phoenix) 9600 activity is on 2M
and is mostly TCP/IP, so I hear.

For a modem, TAPR has two versions (or at least did have)...the K9NG and
their own that is K9NG/G8RUH compatible. The TAPR is quite a bit more
expensive than the K9NG and I assume there's a reason for that. Is it
worth the difference (about $40, I think)? Are there any others I should
consider? Price is a factor but I'd rather spend a bit more if there's a
good reason to do so rather than just going for the lowest price. Kits
would be fine, maybe even preferable.

I'm planning to use the modem with either a PK-88 or a 1270B...any
advantages to one over another?

Now, for radios...I understand that your average 2M transceiver usually
needs some mods to be usable for 9600 but am not clear on what the mods
are or what they accomplish. An explanation of what is required, in
general, would be appreciated. Any specific brand or model reccomendations
would also be helpful.

References to any books or magazine articles would be great, also.

Thanks and 73...   Mark AA7TA

How about just a description:

At the 9th annual Computer Networking Conference in London, Ontario,
a certain NOS developer called it a "brain-damaged protocol that
never should have been invented". I thought it was funny, so I wrote
it down. It's a good thing I did, too, because it somehow never made
it into the conference proceedings.

Well, since I'm part of that crowd, I'll tell you what most people are using. Most of the members of the group (except for myself) are running convert Motorola Mitrek radios, MFJ TNC's, with the K9NG modem from TAPR (which I understand is not available anymore) ... I'm the different one in the group. I run a modified Icom IC-290H, a Kantronics DataEngine, with the Kantronics 19.2 / 9600 baud G3RUH modem. The second port of my Dataengine is also another G3RUH modem, which is using a convert Motorola Mocom 35 @ 438 mhz for the link to the AX25 backbone.

In Phoenix, there is also a digipeater on White Tanks Mountain @ 9600 baud for ax25 use, I forgot the frequency.

David

In article <1993Jan14.210637.5119@ultb.isc.rit.edu> cep4478@ultb.isc.rit.edu (C.E.
Piggott) writes:
>At the 9th annual Computer Networking Conference in London, Ontario,
>a certain NOS developer called it a "brain-damaged protocol that
>never should have been invented".

Well, it did get a reaction from the audience, didn't it?

Seriously, the KISS protocol was originally intended by K3MC and I to
be a temporary stopgap that would let us get some on-air experience
with early versions of my TCP/IP package before plug-in HDLC adaptors
like the DRSI and PI cards were widely available. Obviously it has
lived longer than we expected or intended it to.

Since we designed KISS specifically for TCP/IP, I didn't put in a
frame level checksum or CRC -- the IP, TCP or UDP header checksums
could protect against the (we thought) unlikely possibility of data
corruption on the wire between the PC and the TNC. While this was
valid given our assumptions, a surprising number of people started
using KISS for plain vanilla AX25, which doesn't have an internal
header checksum (it depends on the HDLC CRC, which is stripped off in
the TNC). And because many hams were using old and slow PCs that
couldn't keep up with the data rate on the KISS TNC port, there would
be overruns and lost data.

All this says that if you have a PC you want to put on the air, the

preferred approach is to buy one of the plug-in cards. Lacking that,
install NS16550A chips in your PC's com ports; they have FIFOs that
really help avoid lost data, especially on slower PCs.

Phil

Subject: USING HANDHELDS ON PACKET

someone was asking for a transformer PTT interface for Icom handhelds.
Well here is the file from the GB7BIL mods database

Icom Handhelds on packet
========================

Most Icom Handhelds can be used on packet. This is how to achieve it.

```
TNC                             RIG
~~~                             ~~~
PTT-----------4.7K-------- TIP OF SMALL JACK

TX AUDIO------0.1MF------- TIP OF SMALL JACK

GROUND--------------------- BODY OF BOTH JACKS

RX AUDIO------------------ TIP OF LARGE JACK
```

This arrangement works with most TNC2 type clones, but it has not been tried
on the PK88.

Another possibility would be to use a 1 to 1 audio isolating transformer.
This is a suggestion on how to connect it up:

```
RX AUDIO---------TIP OF LARGE JACK
GROUND-----------BODY OF LARGE JACK
GROUND-----------TRANSFORMER PRIMARY
TX AUDIO---------TRANSFORMER PRIMARY
PTT--------------TRANSFORMER SECONDARY
                 TRANSFORMER SECONDARY---------TIP OF SMALL JACK
```

When the PTT line goes low, it makes the Tx connection for the handheld.
Having said that, on the IC24 there is a ring on the small jack that carries
+5v and you must be carefull not to short this by using a mono jack.

Julian G6LOH @ GB7BIL

Recently I sent a e-mail message to the WB7TPY internet gateway destined
for a ham friend in Arizona. If anyone can help me out, I have a few
questions...

1) If my friends packet system is not available, how long will the WB7TPY
system hold my message?

2) Being a quasi-ham (awaiting my ticket), im not sure if the message will
automatically be forwarded to to my friend or is the message saved on a
BBS that my fried must sign on to?

3) Is it legal for a non-ham to send messages in this manner to a ham? I would think so because the WB7TPY is the station operating in the ham bands and not me...Am I right?

4) What kind of area does this WB7TPY gateway cover?

5) Where can I get more info on similar internet gateways?

6) I am interested in Internet-packet DXing with people in other countries. Does anyone know of internet gateways in other countries?

Thanks in advance for any info...

> 1) If my friends packet system is not available, how long will the WB7TPY
> system hold my message?

My gateway passes everything into the system right away. It doesn't "hold" any mail ... If the system that your friend is on is not available, then the system who passes it to them will have problem delivering it.

> 2) Being a quasi-ham (awaiting my ticket), im not sure if the message will
> automatically be forwarded to to my friend or is the message saved on a
> BBS that my fried must sign on to?

It will be automatically forwarded to a BBS unless your friend has a personal mailbox that a BBS will forward to.

> 3) Is it legal for a non-ham to send messages in this manner to a ham? I
> would think so because the WB7TPY is the station operating in the ham
> bands and not me...Am I right?

Correct, I am working under the assumption that mail from the internet
is third-party traffic.

> 4) What kind of area does this WB7TPY gateway cover?

My gateway will pass traffic to anyplace it is legal for third-party
traffic to go.

I have uploaded to WSMR-SIMTEL20.Army.Mil:

pd1:<msdos.packet>
PAX252.ZIP   Hams: Resident (TSR) packet radio terminal pgm

PAX (ver 2.52) is a resident terminal program written in assembly
with a view towards keeping the code size small and occupy as little
RAM as possible. It has most of the features of larger programs
such as YAPP, yet only occupies 19.8K of memory in its default mode.
It will communicate with two modems, has screen capture to disk,
has review buffer (size can be set from 2048 to 20480, with 4096
as the default), send text files, capture to printer, will set TNC
clock from system, and other features. The perfect program for
someone who wants to check what's happening on packet while operating
in other applications without exiting the application.

Program was written by Raj, VU2ZAP

I have been using GRINOS to connect a pc with a SLIP connection through
another with both a SLIP and ETHERNET connection to our local net at school
and to the wider Internet.

I have been able to get most things to work. However, I have one problem -
the terminal emulation. I am not sure what emulation that these programs
support, and how to modify them. Preferably, I would like them to have
vt100 support.

Is there any body out there who has this kind of information.

Thanks,

Sean

I've been wondering about this too. Being new to amateur radio I'm
still learning a lot! The material I've been studying in preparation
for the tests leads me to some questions regarding the FCC rule that
says operators handling 3rd party traffic are responsible for it. If
the recipients of the email are hams receiving their mail via radio
then:

What if someone sends email containing obscenities.
What about sound files containing music?
What about email to mailing lists -- is this considered broadcasting?

I'm looking for a very small packet TNC for use with an HT
on 2 meters. The old Heath Pocket Packet would be ideal.
I can't use the Baycomm unit, as I'm using a dumb terminal,
not a PC. Any help? Thanks.

Hello Networkers,

I am searching for the optimal equipments (performance , price) in order to build
a packet radio transmission system.
Can anyone help me to get technical characteristics and prices of:
       -TNC
       -MODEMs
       -TRANCEIVERs
Any help will be greatly appreciated (may be adresses of manufacturers)

Thank you.
khaled.

I would recommend using Giles Todd's VT102.COM instead of ANSI.SYS; the former
is an ANSI screen driver that responds to VT100 Esc sequences. I have been
using it at home and work quite successfully for VT100 emulation.

It seems to work with Unix machines I connect to. For the VMS machines, my
login.com file has the line "set term=VT100". Works on both systems.

*** Welcome to rec.radio.info! ***

Welcome to rec.radio.info, a group that aims to provide a noise-free source of information and news for the entire rec.radio hierarchy.

Two introductory articles about rec.radio.info are posted to the group and to news.answers every two weeks. You are now reading the first article, which explains what rec.radio.info is, and answers some Frequently Asked Questions. The second article is titled "Submission Guidelines", and you only need to read it if you want to submit an article to rec.radio.info.

 -- What is the purpose of rec.radio.info?

The purpose or charter of rec.radio.info is to provide the Usenet community with a resource for information, news, and facts about any and all things radio.

All the other rec.radio groups are intended for discussions and general chit chat about radio. Rec.radio.info will contain informational, factual articles only. Follow-ups are redirected to an appropriate other group, and further discussion (if any) will not take place in rec.radio.info.

In order to ensure that rec.radio.info contains only appropriate articles, it was decided to create the group as a moderated newsgroup.

 -- What is a 'follow-up', and what does 'moderated' mean?

If you are new to Usenet and are not familiar with the terminology, you might want to read the general introductory articles found in the newsgroup news.announce.newusers. Doing so will make your life on the net much easier, and will probably save you from making silly beginner's mistakes.

If you think that at this moment you are reading an echo, a conference, or a bulletin board, I'd also strongly suggest a trip over to news.announce.newusers.

For the rest of this article, I will assume you have a basic knowledge of Usenet terminology and mechanics.

 -- OK, so now I know what 'moderated' means. Tell me more.

Rec.radio.info is a moderated newsgroup, which means that all articles submitted to the group will have to be approved by the moderator first.

The current moderator of the group is Mark Salyzyn. Submissions to rec.radio.info can be posted, or e-mailed to:

          rec-radio-info@ve6mgs.ampr.ab.ca

Comments, criticisms, suggestions or questions about the group can be e-mailed to:

          rec-radio-request@ve6mgs.ampr.ab.ca

But before you do so, please be sure to check out the "Submission Guidelines" article.

The influence of the moderator should be minimal and of an administrative nature, consisting chiefly of weeding out obviously inappropriate articles, while making sure correct headers etc. are used for the appropriate ones.

-- What type of material is considered inappropriate?

There are three broad categories of articles which will be rejected by the moderator:

1) Requests for information: rec.radio.info is strictly a one-way street. I receive information in my mailbox; I then post it to rec.radio.info. Requests for specific information belong in the normal discussion newsgroups. If your request gets answered, you might consider passing the answer on to rec.radio.info, though. Especially if you can edit it into a informational, rather than a discussion, format.

2) Obvious discussion articles, or articles that appear unsubstantiated.

3) Commercial stuff: a relatively unbiased test of a radio product would be accepted, but any hint of for-profit might be reason for rejection. For three reasons: This is not the purpose of the list, for-profit is a controversial topic, and this list may be passed onto Amateur Packet Radio (where for-profit is prohibited except under certain provisos).

   rec.radio.swap may be more deserving of the posting in any matter.

   Similarly, copyrighted material generally cannot be used. If it's TRULY worthwhile to the net, I would recommend obtaining permission from the copyright holder. Please note the source, and if permission was given. I reserve the right to make the final decision concerning appropriateness in all situations. In most cases, a brief summary of, or pointer to, the copyrighted information may be all I can allow.

-- Will the material appearing in rec.radio.info be archived somewhere?

Yes. Still firming up details at the moment but here is a preliminary list:
- unbc.edu as maintained by Lyndon Nerenberg <lyndon@unbc.edu>
- nic.funet.fi maintained by Risto Kotalampi <rko@cs.tut.fi>
  saved to /pub/dx/text/rec.radio.info currently stored as numbered files.

Effectively this means that anything you post to rec.radio.info will be permanently stored, so your work will not be lost.

-- I have a regular posting with timely information, is there a way to speed up it's delivery, or automate for more convenience?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the

articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as timely.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

I suggest reading the posting guidelines for more information. I am open to suggestions.

*** rec.radio.info - Submission Guidelines and Etiquette ***

Two introductory articles about rec.radio.info are posted to this group and to news.answers every two weeks. You are now reading the second article, which explains how to submit something to rec.radio.info, and which answers some Frequently Asked Questions about the submission process. The first article is titled "Welcome to rec.radio.info", and it might be a good idea to check it out as well.

-- How do I submit something to rec.radio.info?

Two possibilities. You can use your newsreading software to just post the article to rec.radio.info, as you would do with any other newsgroup. The difference is that the software recognizes the special status of rec.radio.info as a moderated group, and will e-mail your article to me, the moderator, instead of posting it to the group.

Alternatively, you can mail your article directly to me at the following address:

    rec-radio-info@ve6mgs.ampr.ab.ca

Mailing me directly is probably (a wee bit) faster, but using the transparency offered by the newsreading software is probably more convenient.

If you have any questions, or wish to deal with some administrivia with the moderator, I suggest mailing to the following address:

    rec-radio-request@ve6mgs.ampr.ab.ca

-- How soon will I see my article appear?

It depends on how busy I am. Your article reaches me as mail, I have to read it first, possibly edit it, give it the stamp of approval, and finally send it on to the group.

I try to check and process the rec-radio-info mailbox at least three times a day. Since my site is UUCP connected (and in Canada, sometimes viewed as

a foreign country from the US :-), the turnaround time may be somewhat lengthy. If you post a periodic article, and have shown to be trustworthy, we may allow you to post directly if the article is of a timely nature. See the section below on direct posting.

-- Should my article be in a specific format?

No. If it is not totally illegible, I will accept it, and if it does not have a correct subject-line I will correct it -- that's what a moderator is for.

However.

You could do me a big favor by making sure your article conforms to these simple requirements:

1) The article must present information, not discussion or requests, I will reject the article or require you to change the wording if it is worth it.
2) A good, descriptive Subject line.
3) Always mention what source you got the information from.
4) Don't forget to include a Followup-To header, at least if you don't want further discussion to automatically be forwarded to you, the poster, which is the default if the article is only posted to rec.radio.info.
5) Please try to keep commercial advertising out of the signature. One of the goals is to allow many of these messages to traverse through to Amateur Packet Radio, and even a mention of a company name can get some of the Arm-Chair lawyers up in arms :-}

As I said: if your article is appropriate I will post it even if you don't follow these guidelines, but then don't blame me for not processing it immediately. 'Perfect' articles I can send on with a couple of keystrokes. Stuff that needs minor editing is going to have to wait until I have time to do so.

Please do not waste both mine and your time by posting requests, as this is an information only news group.

-- What about cross-posting?

If you send something to rec.radio.info, just name any group you'd like to cross-post to in the Newsgroups field. Then, when I approve the article for rec.radio.info it will get automatically cross-posted to any other groups mentioned. This will also override the default Followup-To: poster, replacing it with the groups you cross posted to.

I would prefer if the group be cross-posted to the various discussion groups in the rec.radio.* heirarchy that are appropriate:

```
rec.radio.amateur.misc    Amateur (ham) radio and related matters
rec.radio.amateur.packet  Amateur Packet Radio discussions
rec.radio.amateur.policy  Amateur Radio practices, rules, etc.
rec.radio.noncomm    Non commercial radio discussions
rec.radio.shortwave      International broadcasting on the 'HF' bands
rec.radio.cb         Citizens Band (27 MHz) discussion
alt.radio.scanner    Scanner discussions (unsupported group)
```

or in the moderated group:
     rec.radio.broadcasting   Discussion of *domestic* radio broadcasting
I will leave it up to the poster to decide which group(s) are appropriate, but reserve the right to add groups if I feel it has broader interest.

Note: rec.radio.broadcasting is also a moderated group. It *may* be necessary to 'manually' post your articles to it's moderator. If you wish the article to cross-post to rec.radio.info and rec.radio.broadcasting, place the e-mail address of - rrb@airwaves.chi.il.us - in the Cc: (carbon copy) field when you mail, and state, in the article, where you want the Followup-To: to be set. Since William Pfeiffer, the rec.radio.broadcasting moderator, is part of the moderation team for rec.radio.info, I will typically abide by his decision whether the article is appropriate for rec.radio.info.

If you post to another moderated group it may be better to make special arrangements with both moderators before posting by contacting us at our administrivia addresses.

In addition, cross-posts do not take up extra space; modern newsreaders can be configured to show you cross-posted articles only once anyway; not everybody reads rec.radio.info; and rec.radio.info was never meant to reduce the volume of the regular discussion newsgroups. But keep in mind that some of the mail gateways may filter out the informational postings (at request of the subscribers) to keep the load down.

You decide.

 -- I have a regular posting with timely information, can I make arrangements
    to help speed up delivery by posting directly from my site?

Yes, there is! It may take a bit of chatter with the moderator, but we are willing to take responsible people and provide them the means of posting the articles directly from their site. We will try everything we can as we fully realize that DX (distant signal) and astronomical data can be somewhat transitory. We are also willing to allow regular posters of information the same courtesy, even if the information is not as timely.

We refer to this as self-moderation, which is partly based on the model for news.answer. This requires co-operation and good will to be beneficial to the community in the rec.radio hierarchy.

If you are currently maintaining (or plan to maintain) a radio-related periodic information posting, you may wish to consider cross-posting it to news.answers. Postings that are approved by the news.answers moderator for this treatment are automatically pre-approved for cross-posting to rec.radio.info (as the news.answers requirements are far more rigorous than the requirements this newsgroup ever plans to use). For more information about this option, consult the appropriate information articles and posting guidelines in news.answers.

Realize also, that even if your post is not approved for news.answers, it can still be approved for rec.radio.info. The intention is not so much to get every last bit of radio-related information on news.answers, but rather to provide an alternative avenue of approval (as well as grandfather existing

maintainers of radio-related information and spare them additional bureaucratic hurdles). Again, cross-posting to either rec.radio.info or news.answers, both, or neither, is at the discretion of the poster (subject to the approval of the moderators). You decide what is most appropriate for your article.

Please remember that as an information maintainer, you are not alone. There are many others on the net who maintain and post periodic information postings, using various intermediate-to-advanced features of Usenet (usually via automated tools). Various degrees of technical support and general hand-holding are available from many Usenet veterans. Send me some E-mail describing your needs, and I'll try to help, or at least refer you to the right knowledgeable individual(s).

-- And Follow-ups?

If the only newsgroup you have specified is rec.radio.info, then the Followup-To: field will always be set to poster. If you do not want this, you must supply a Followup-To line of your own, and I will honor that one.

If you specify newsgroups to cross-post to, then the Followup-To field will be set to include all the cross-posted groups, excepting rec.radio.info itself. Again, if you do not wish this behavior, supply your own Followup-To line.

-- Why have I received no reply from you?

I never reject anything in silence, and I make a point of it to answer all my mail. However, e-mail can and does get lost, every now and again.

So, if you send me something, and you don't see it appear it rec.radio.info, and you still have not heard from me in reply after say, one week, you can be pretty sure that either your mail never reached me, or that my answer has never reached you. In that case, please try again.

   In general international "third-party" traffic by amateur radio
is forbidden. This is particularly true for messages which are not
related to amateur radio. Some countries, perhaps a few in Europe,
have treaties with the U.S. which waive this prohibition to greater
or lesser degree. Try American Radio Relay League, 225 Main St.,
Newington CT 06111 USA phone 203-666-1541 for information about
specific countries. Business or commercial traffic by amateur radio
is always prohibited.

I have done some studies of modulation techniques proposed for the next
generation moble telephone systems and found CDMA (spread-spectrum) to
be optimal. I agree that CDMA would also be great for amateur radio,
but I thought CDMA is patented by Qualcomm. What effects will the
patent have on developing CDMA packet networks?

    I arrived at more or less the same conclusion that SS was a good
    avenue for future packet development, primarily because direct
    sequence spread spectrum is probably one of the cheaper ways
    to "fix" the multipath problem in high bit rate packet systems.
    The main hitch with CDMA (code division multiple access) is that
    the amateur radio service is allowed to use only three spreading
    codes. Is there work being done towards relaxing the regulations
    on use of spreading codes?

[...deleted...]>
>What if someone sends email containing obscenities.
If you can't say it on the air, then you can't send it as text. That's
why many (most? all?) *mail gateways* operators have to make sure the
mail is not automatically snet on the air.

>What about sound files containing music?
How'd you get those sounds into the file?...Oh, you mean encoded files
with data that could be decoded and then sent to some device that would
produce music... No problem. 8-)
>What about email to mailing lists -- is this considered broadcasting?
No. Not anymore than packet bulletins or "all@ww" addrerssing.

All of the above just my humble opinion. Note follow ups set to
rec.radio.amateur.policy.

Cheers,
 Willis n5szf

> Is there work being done towards relaxing the regulations on use of
> spreading codes?

This actually sounds like an interesting topic to persue, and as (far as I can tell) the UK regulations do not limit the use of SS, I'd like to give it a go. Now I've just got to get some more info on SS, any references would be appreciated.

Cheers,

DF

Get the latest KA9Q (930104), and set your term type to ansi. It hasn't choked in vi yet, a pretty good test for an emulator.

Good morning. It's Sunday the 17th of January and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- A double celebration at RSGB HQ; the antarctic expedition is at the South Pole; and the Kidderminster rally has been cancelled.

Last Monday, the RSGB celebrated two happy occasions. The first was the presentation of a certificate to Britain's first astronaut Helen Sharman OBE marking her election as an Honorary Member of the Society. The presentation was made by the President, Peter Chadwick, G3RZP. In her acceptance speech she said the certificate embodied all of the friendships she had made through her involvement with amateur radio. Sharing the limelight with Helen Sharman was the longest serving member of RSGB Headquarters staff Derek Cole who for 25 years has been the Technical Illustrator of RadCom and most RSGB books. The President presented Derek with a magnificent engraved barometer.

Laurence Howell, GM4DMA, reports that Ran Fiennes and Mike Stroud should be at, or just past, the South Pole by now. They have already walked half of the gruelling 2,200 mile journey across Antarctica. The aim is to be the first to cross the Antarctic on foot and at the same time to raise 2M for research into Multiple Sclerosis. They are in good spirits and their physical condition is reportedly good despite Ran's weight having dropped by 42lb. Morag Howell is providing the expedition communications from Patriot Base. Morag is active

on the HF amateur bands when possible as GB4MSS/VP8 but operation is from batteries charged by solar cells so power must be used sparingly.

The Kidderminster and District Amateur Radio Society regrets to announce that its rally which was scheduled to be held on Sunday the 21st of February has been cancelled. Further details from Geoff Philpotts, G0RJP whose address is correct in the 1993 RSGB Call Book.

The chairman of the RSGB VHF Committee, Peter Burden, G3UBX, tells us that the UK has, along with other European countries, agreed to the use of 433.050 to 434.790MHz for 'low power devices' limited to 10 milliwatts. Following representations from the RSGB, the Radiocommunications Agency has undertaken, in the event of problems being experienced, to defend the amateur service. The RSGB and the RA will be paying particular attention to receiver specifications. This new allocation does not in any way affect the present or future status of the amateur service on 432MHz. Amateurs should continue to use the 432MHz band normally and should continue to plan and install new equipment for this band.

Next a reminder that the Winter Microwave Cumulatives, which are non-competitive events take place on Sundays: the 31st of January, 28th of February and 28th of March. Bands to be used are 2.3GHz upwards. The Adjudicator is Steve Davies, G4KNZ, whose address is 14 Herondale, Birch Hill, Bracknell, Berks, RG12 7ZT. A report on the Cumulatives will be published in the Microwave Newsletter only. Further details can be obtained from Ted Jewell, G4ELM, whose address is correct in the RSGB Call Book.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Pitcairn Island, VK4CPU and WK3D will sign VR6BB and VR6JJ respectively from early January until March, exact date depends on transportation, on all bands 6 to 160 metres using CW, SSB, RTTY and FM. From the Cayman Islands, K0BJ will sign ZF2NJ from today Sunday the 17th, until Sunday the 24th of January on 10, 15 and 20 metres using mainly CW, plus some SSB on 10 metres. From Auckland/Campbell Islands, HB9TL will sign ZL9/HB9TL from the 15th to the 21st of January. Check 14.192 or 14.242MHz SSB. From Barbados, VE3ICR will sign 8P9DX from the 23rd of January, until the 6th of February, taking in the CQWW 160 metres Contest. From Tonga, A35CT hopes to be active for the next 2 to 3 years, check 14.219MHz at 0530GMT.

Rally news now and we know of no rally scheduled for this weekend, but there are two events next Sunday, the 24th: The Lancastrian Rally is to be held at the University of Lancaster. Doors open at 10.30 for disabled visitors. Further details can be obtained from Sue, G1OHH, by telephoning 0524 64239. The Oldham Amateur Radio Club's Mobile Radio Rally is to be held at the Queen Elizabeth Hall, Civic Centre, West Street, Oldham. Doors open for Morse Test participants at 1000am, for Disabled visitors at 1030 and at 1100am for all others. There are catering facilities and ample car parking. Talk-in on channel S22 from 0900am using the callsign GB4ORC. Further details can be obtained from Kathy, G4ZEP, by telephoning 061 633 0550 during the day time, or 061 652 8617 evenings.

Next, a date for your diary:

International Marconi Day 1993 will be held on the 24th of April. A number of special events are scheduled. We will bring you news of these nearer the date.

Some HF Contest news now:

The RSGB LF Cumulative Contest sessions take place as follows: The 7.0MHz sessions are today Sunday the 17th and next Saturday the 23rd, from 1000 to 1200GMT. The 1.8MHz event is scheduled for Wednesday the 20th, from 2000 to 2200GMT. And the 3.5MHz event is on Sunday the 24th of January, from 1600 to 1800GMT. For further details see page 62 of December's edition of Radio Communication.

Now the VHF Contest news:

Today, Sunday the 17th, the 144MHz CW Single Operator Fixed, All Other and SWL Contest will run between 1000 to 1600GMT. The 70MHz Cumulative Contest is scheduled for next Sunday the 24th, from 1000 to 1200GMT. This the first of five 70MHz Cumulative Contests to be held during January to March. For further details see December's RadCom page 61.

And now the solar factual data:

The period 4th to 10th January has seen a lot of magnetic disturbance, with little solar flare activity in spite of the more active side of the sun coming into view. No flares of any note have been reported. The sunspot count steadily rose over the period and meaned about the 119s. Solar flux levels hardly varied day to day and averaged 128 units. The geomagnetic Ap index averaged 23 units, but has been up to sub storm levels on the 4th, 7th, and 10th, reaching up to 34 units, with K figures up to 7 on the 10th. The state has been 'mag storm' most days, with the higher latitudes and night times being mostly affected. The radio quality indices started at very poor and slowly improved as the period progressed, with levels reaching normal by the 10th, there was no good circuit, but on odd days the Tokyo circuit was above normal, so generally conditions have been poor. The aa indices, as supplied by the British Geological Survey, for the 29th of December to the 4th of January gave daily averages of 32.5 nanoTeslas, about K3. The 29th was up to 59 nanoTeslas with the afternoon period being up to 102 about K5. The monthly mean sunspot count for December was 83.3 with the maximum of 132 on the 11th and the minimum of 34 on the 7th, The predicted smoothed count for June 1992 was 97.1 +/-5.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, averaged 10.7MHz, for some unknown reason the 8th saw a high level of 12.4MHz, but this was not reflected in other parameters. The darkness hour lows averaged 2.6MHz. Spread F has been reported lasting up to 6 hours some days, mainly during the very early morning periods.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 8.6MHz, with the

darkness hour lows being 2.6MHz. Interest in geomagnetic activity has grown in recent years and more reliance is now being placed in the K figures. These are indices of activity covering a three-hour period, with eight figures for the 24 hours. This is therefore a quick way to highlight the quiet or active periods during any day. Ap and aa indices as used in these bulletins are in fact all available in K figures.

And lastly the solar forecast:

This week, the most active side of the sun will have passed by, so solar flux levels are expected to be about the 125s, geomagnetic activity is expected to be just unsettled at first becoming quieter as the week continues. HF band conditions are expected to be normal with daytime MUFs up to 30MHz. and darkness hours up to 14MHz. With the seasonal changes taking place east/west contacts are now becoming more difficult during darkness hours.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S X and G7 N Y series, and Novice calls in the 2 0 A E and 2 1 B I series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Note: this message cross-posted to both comp.protocols.ppp AND
       rec.radio.amateur.packet!!

Greetings!

I'm attempting to coax the latest release of KA9Q to dial my workstation

(running dp-2.2) and initiate a PPP link. I've encountered two rather significant obstacles:

1) 'ppp pp0 lcp|ipcp open active' does nothing. The default for dp-2.2 is to open a passive dialup session. The two boxes could sit around forever and never talk to each other. I've even tried PPP between two KA9Q boxes, one active, one passive. Still zippo. What am I missing?

If I open passive in KA9Q after initiating an active session on the workstation, that at least gets the boxes talking, but the link never fully comes up. It apparently negotiates LCP, passes the IPCP addresses, then gets stuck, the workstation sending the same packet over and over, KA9Q responding with what looks to be an ACK.

2) How in the world does the new dial command work?!?!? I seem to recall an article regarding Phil's link-redialing enhancements, but I'm perplexed as to what needs to be done. I'm used to 'dial pp0 dialer.pp0'

Please pardon my ignorance, but I'm new to PPP and it's configuration. Any and all help will be greatly appreciated!

Thanks,
Derrick

Lines: 15

I'm interested in writing a client program for packet. That is, instead of using my packet controller's usual maildrop, I want software on my PC to talk to it. I know that software exists already for this -- bbses and whatnot -- but I'm interested in writing my own, in C, perhaps a game or something.

I'm not too familiar with the AX.25 protocol (at least on a system level
where a program needs to make sence out of it all!) and I'd like some
information about what needs to be handled, how to send actual stuff
over packet via my own program, etc. Has anyone done this who will give me
some pointers? Or do some docs exist on the net that can help?

Thanks in advance
Kevin kc6gwq - waffle@steer.sdsu.edu

I would like to inquire if anyone on the list has had a similar problem to the
following:

A friend is using a TS140s and a MFJ Multi-Mode TNC connected via the
Accessory port. Like previous communications about the ts850, 950, 690
(mine) he is suffering from audio distortion if he leaves the TNC
connected when using SSB. I have solved tha problem in the past on the 690s
by effective grounding of my PK232MBX to the 690s (thanks Dick, KD5VU).
My questions are: is the acc port on the 140s the same as the 850, 450,
690 etc or different? and - Has any one else had a similar setup with
a MFJ unit and solved it. He must stay with AFSK since I believe the
140 does not permit FSK operation.

Replies may be sent to the list (since the information would be
of value to those who still disconnect their TNCs prior to SSB
operation) or direct to :

SEELER@UPEI.CA

Thank you for your help in this matter (and for solving the Kenwood
floating ground problem once again).

Hello all,

Just one Question: Did anyone succeed in running a BAYCOM Modem/TNC under
Linux ? (My baycom-Modem is the only reason for me to still have a dos
bootdisk).

Perhaps I can write the required software of my own, where can I get more
info on the way the baycom piece works?

Any help will be greatly appreciated.

Regards,
Ralf

Quent Johnson (quent@md.fsl.noaa.gov) said:

What if someone sends email containing obscenities.
What about sound files containing music?
What about email to mailing lists -- is this considered broadcasting?

I say:

I'm sure the control op eithe inspects the mail (unlikely) or has a
kill file that looks for "obsscene, indecent, or profane words" in the
text and doesn't allow transmission if it finds one. The full part of
97.113(d) goes futher than this though: obsscene, indecent, or profane
words or meaning [it might be difficult to stop the later with a kill
file is only 'clean' words are used]; and/or false or deceptive
messages or signals [this too are more difficult to detect]". Once must
also be wary of commerical messages (i.e look for the string "900" :-).
THe FCC did backoff on the responsibilities of sysops who relayed
messages in the system, the originator having the full responsibility.
Unfortunatly the control operator of the gateway is the responsible
person in this case. This may explain why there are very few gateways.

Data files containing musical sounds are only musical sounds when
played on the appropriate equipment. They don't sound like music on the
air (just sound like packets too me) so they're not in violation of
Part 97.113(d). Consider why this rule was put in place originally and
you can see it can't apply to data files. This might actually become
important with more people getting into multimedia.

All the transmission are point to point on the ham side, so there is no
broadcasting involved. Note to that bullitens (messages with multiple
destinations) are allowed in the packet system and are not considered
"broadcasts" because all transmissions involved are two way QSOs
(between the BBSes passing the messages and the intermediate nodes).

In general, don't under interpret the FCC regulations and don't ask the
FCC what the rules mean, as they'll often come up with a more
conservative ruling futher restricting experimentation in the amateur service.

Follow ups are best directed to rec.radio.ham.policy

The latest versions of NOS that I've released have their own built-in
terminal emulation; they no longer use ansi.sys or whatever.

The very latest version emulates a 24x80 ansi display, with most (but
I won't guarantee all) vt-100 functions as well. The generic "ansi"
termcap entry seems to work well.

I haven't done the vt100 keyboard yet, but that's on my list.

Phil

I'm sure if there was a real need to change the rules, the FCC would be willing to change them. There's an STA in existence right now that waives this requirement.

Of course, there are still all the other restrictions on amateur radio, particularly the content rules, that would be much more difficult to change. That's why I think Part 15 (and possibly user-provided "data PCS" on 1.8 Ghz) is where the future of packet radio lies.

Phil

ANNOUNCING A NEW MACINTOSH PROGRAM FOR PACKET

Packet Tracker
V1.04
by
Mark Sproul

PacketTracker is a program that monitors packet activity and keeps track of what is going on. It draws a graphical map showing who is talking to who and displays statistics of all current stations and keeps a running tally of activity .

PacketTracker was written for both the casual packet user and the network manager or BBS operator. The casual packet user will be able to learn a

great deal about what is happening in packet around him; which stations are generating the most data and what some of them are. He will also be able to see graphically what stations he can hit directly and which ones he cannot.

   For the network manager and BBS operator, PacketTracker provides extensive insight to the operation of the local network and the problems such as excessive retries on a path. It also allows for extensive logging of channel utilization and other pertinate information.

PacketTracker is freeware. Copies of the program will be made available on the Internet and on various online services. It will also be available on the April 1993 Buckmasters CD-ROM. If you want me to send you a copy of the latest version on a disk via US Mail, please send me $10.00. If you want me to include a printed copy of the manual, send $13.00.

   This software is a project of the Radio Amateur Telecommunications Society (RATS).

>I agree that CDMA would also be great for amateur radio,
>but I thought CDMA is patented by Qualcomm. What effects will the
>patent have on developing CDMA packet networks?

Generic, basic CDMA (i.e., multiple spread spectrum transmitters sharing the spectrum) has been around for a long time -- since World War 2 -- so any patents on it have long since expired. Qualcomm's patents cover only some very specific implementation details on applying CDMA to cellular telephony, particularly the closed-loop power control scheme.

I can't speak for management, but I can say that the three senior engineering VPs are all hams, and have spoken very favorably of the possibility of applying our CDMA system to ham radio. Of course, we currently have our hands more than full finishing the commercial system and getting it standardized and deployed by the industry...

I have read some FAQs and found 2-meter packet frequencies. It seems that some
HF frequencies are also in use.

Can anybody supply information about HF frequencies?

Thanks in advance.

I'm implementing DS spreading in my second phase of higher speed radios which are to be part of the "layer 3 TNC" we're working on for user access to a higher speed wide area amateur digital network. This is being done to help combat multipath on less than optimum paths. I haven't yet found the limitation of spreading codes; the particular 7,13 and 19 bit sequences specified by the FCC, to be too much of a problem. Since I'm already using a moderately wide information bandwidth, pushing 1 MHz, I run out of spectrum within the band before I run out of code length. Specifically, at 1200 MHz I only have about 50 MHz to spread in (1240-1290 MHz so that weak signal at 1296 can be adequately protected) and if the data is randomized to begin with, a 7 bit code with 127 states is more than enough to "fill in the holes".

For those that want to play with SS, the ARRL Spread Spectrum book and of course the original reference, "Spread Spectrum Techniques" by Dixon are good starting places. I'm not a member but I understand that the amateur group, AMRAD, is also supporting and furthering amateur investigation of SS.

I'm happy to exchange ideas/solutions with others that are experimenting with SS for amateur uses.

How should i put up my system if I want a BPQ switch to be the radio interface.
Today i have tryed this:
in bpqstart.bat:
bpqcode
nodedrv4 0x61 60 1
nodedev4 0x62 61 2

in autoexec.net:
hostname sm5ohi.ampr.org
ax25 mycall sm5ohi-3
ip address [44.140.176.5]
attach packet 0x61 ax1 5 256
start ax25
start netrom
netrom interface ax1 OHIIP1 192

And Im usning g8bpq multiport kiss. (BPQKISS)
It dont work! And i have tryed with and without bpqhtnc2.
It look like a bug. It just dont receive anything at all!

Any ideas ?!
/Peter, sm5ohi

Which 3 codes are the chosen ones ? I suppose this was done to
stop people thinking of it as "encryption". Are there any
minimum process gain rules too ? (I understand the FCC recently
tightened up on the requirements for Part 15 stuff..)

We are looking to install a backbone system around the SW Pa area. What
I've seen of the TexNet system is OK, but we would like to go > 9600 for the
backbone. (19200 is OK, 56K is preferred).

One of the ideas that we have is that each point to point link is on its own
channel (multiple transceivers), another is that there is only one
transmitter per site, but multiple receivers. In either case, we certainly
need more than two ports per node.

As ease of use (user transparency) is very important, a multiple NET/ROM or
TheNet hookup is not acceptable.

Any ideas?

A friend and I, recently set up the KA9Q NOS, I have an older version
(920306 or somthing like that) and we are trying to net a few Areas
togeather, We would like to get into the main net, but we

are trying to figure it out first, does anyone know how to net
some areas? we did as the doc said. This is what we tried:

/alias file:
packet   packet
/spool/rewrite file:
packet@* packet
/spool/forward.bss:
kd6dzp
ax25 ax1 kd6dzp (somthing here, but forgot)
packet
/spool/areas file:
packet   Test netting area

and, that doesn't seem to work, anyone got any Ideas to what we could
be doing wrong? Also, does anyone know how to apply to get into the
TCP/IP NOS net?

Hi there,

I was wondering what type of connector the AEA PCB-88 uses to connect to a
radios mike and speaker jacks. I just ordered one this evening and would
like to make the connecting cable before it arrives. FYI I'll be using an
HTX-202 for my packet setup and already have the details for the radio end
of the cable (see the April 1992 issue of CQ, pages 34-36).

Thanks for any info.

Subject: Servers for AA4RE 2.12 to update HLOOKUP?
Date: 19 Jan 1993 07:26:16 GMT

Organization: Jet Propulsion Laboratory, Pasadena, CA
Lines: 23
Distribution: usa
Message-ID: <1jgaeoINN37h@elroy.jpl.nasa.gov>
NNTP-Posting-Host: kilroy.jpl.nasa.gov

Well, almost got the whole thing in the subject!

I'm looking for a server for the AA4RE 2.12 BBS that will look at
messages that pass through my system and update my HLOOKUP.BB file.
Also, if possible, perhaps this server could update some additional
file that could be used for REQWP services so users could query
the file for a full HADDRESS given only a BBS callsign.

Anybody seen something along those lines?

Thanks!

Hi all packeteers,

I would like to get into packet radio as I just recently got my
Basic/Technician's license. I am currently running a Commodore 64 with a
1541 Disk Drive. I haven't bought an HT yet, will probably buy one
within the next couple of months. I like the features/looks/weight of
the Icom P2AT.

So with this information I would like to get some feeback as to what I
can buy for a TNC only unit that is TOTALLY COMPATIBLE with the Commodore
64. Thankx in advance.

: need more than two ports per node.

: Any ideas?

  Several years ago n8xx suggested "hexnet". This was described as an
alternative to "linear" networks. It involved multiple receivers per
site and several different transmit frequencies in total.
  I have a copy of the original suggestion if you would like me to
forward it. I also have a copy of a reply I made to it at the time
which suggested some practical hardware with which to implement it.

  My own preference is multiple dedicated point-point links with
switching/routing done on a multi-port highspeed controller. This
is the general approach we are trying to implement here in northern
CA. The problem is that we aren't rich enough to afford the required
hardware and we're initially trying to make do with a much smaller
subset of this.

Let me know if you would like the hexnet proposal and/or my followup.

I can name a book that you should *not* waste your money or time on.

DON'T BUY "PRIME: Packet Radio is Made Easy" (published by MFJ).

I picked up this piece of trash at a hamfest and am absolutely amazed that
MFJ (or any company!) would want its name attached to such bad writing.
It's obvious that no proofreader ever laid an eye on the text before it
went to press. Organization is poor; the author wanders aimlessly from one
topic to another with little linkage between topics. Information oscillates
from fuzzily vague to MFJ-specifically detailed. There is no indication on
the cover or in the introduction that 80% of the information in the book is

specific to MFJ TNCs and software (neither of which I possess); if you did buy MFJ equipment the book might be marginally more helpful to you.

In all fairness, I must note that the copy I bought (last November) was copyrighted 1989 - it's possible that there are new editions with corrections and revisions available. If so, I haven't seen them.

Good luck...

I have an AEA PK-88, IBM 486-33 running OS/2 2.0.

I have tried ACEPAC2 and PCPACRAT. Unfortunatly, both of these only use
COM1 or COM2. (Com1 is my modem, Com2 is my mouse) Com3 is my PK-88.

Question: Are there any descent packet programs that use Com3 (on IRQ2 or
     IRQ9).
By descent, I mean allowing multiple sessions, mailboxes, etc. I have a nice
generic terminal program, but it's not fancy enough for me. With any luck, I
would like to use it for a small bbs in the College Station/Bryan, Tx area.
I would prefer ShareWare (I have FTP capability), but commercial is
also fine. The program does not need to be written for OS/2 since I can use
DOS as well.

Any information would be greatly appreciated.
Please respond by e-mail if possible.

Thanks in advance,

-Neal Krawetz

Were I to do the San Diego Metro net over again, I'd put a single packet
9600 bps repeater up on a central location, and have all the outlying nodes
and services connect through it.

Later, when there are more than two 9600 bps USER stations on the air in
town, we'd upgrade the repeater to 56kb.

Simplex packet is so difficult to make work properly* that it's really
not worth trying.
     - Brian

This is what we're in Dayton with the 19.2 repeater. It provides the
"backplane" for the other services to connect to. Rather than upgrade
speed (for right now) our plans are to add a second repeater when the
load is high enough to justify it -- we'll put users on one repeater
and servers on the other.

>Later, when there are more than two 9600 bps USER stations on the air in
>town, we'd upgrade the repeater to 56kb.

Given the way folks are not rushing to embrace a solution that's about
as close to "plug and play" as it gets, I don't anticipate we'll need
the second repeater for a couple of years...

>Simplex packet is so difficult to make work properly* that it's really
>not worth trying.

It's worth noting the the switch to a new baud rate/frequency/band is

the ideal -- and probably the only -- time to implement a network like
this and have some chance of getting it to work. Once users have
settled into the simplex-"helped"-by-digi mode, inertia will make it
almost impossible to change to a network that works.

John

Hi, we're trying to get ax25 running on a sparc station. we
have a copy of the ax25 for the sun (written by a ve6) installed.
Pings to get transmitted. etherfind sees the packets coming
and going. the packets look good going on the radio side both to
and from the station. the problem is that the interface to
the window that we're working from (originating the ping) does
not get any responses. It seems as though the low level routines
see the packets, but they never make back to the sun window for
display. We're running 4.2 release. Thanks for any pointers, we
are a little stumped at the moment. We really need a working ax25
interface on our sun, and we'd really like to do IP after
that. So any help would be greatly appreciated. I have also
sent this to the tcp mail group.

This is a Buck Rogers book. Buck's the CQ packet editor, and his writing
is of CQ quality. :-) He writes the way he talks, in great volumes and
with little sense of grammar or spelling.

Buck is highly opinionated, and his opinions change daily. :-)
The hookup information he gives is largely correct, but the
quaint ideas he has on networking and network services are best
taken with a large grain of salt. This is especially true in older
editions. He has progressed(?) from championing digis, to Netroms,
to Rose, and finally he's now asking questions on how to setup TCP/IP.

He has enormous stores of enthusiasm, and he's a real doer.
Reading his book gives you insight into the typical amateur's
approach to packet. He championed the C64 long after it was
dead and is just now moving into commodity PCs. His model
of packet is as an interactive keyboard to keyboard service.
Don't use this book as a definitive text on networking, or
network services, but it is a valuable text for gathering
insight into the ways real amateurs are using packet radio
and to the obstacles developers of real networks face.

>Any ideas?

Hubs with multiple receivers and a single transmitter can be useful
when dealing with a user base. This is a technique used by AMSAT
with the Pacsat birds. However, it makes network topologies and
frequency reuse plans really complicated. Dedicated, full duplex
backbone links are best, with a frequency reuse plan that alternates
channel pairs in a cellular layout. This means that a switch needs
at least 3 ports. One for neighbor left, one for neighbor right,
and one for the user LAN. A Kantronics Data Engine is suitable for
this kind of network tap. At a site where several trunks are hubbed,
however, you really need a PC with multiple dedicated DMA capable
cards, like the Gracillis cards. Running a switch optimized version
of KA9Q, these can handle 5 or more ports.

I wrote the mulport code in early versions of KA9Q to make the
system look simple to users. To them it looks like a flat digi
network all operating on the same channel. They use normal digi
strings and the system routes their packets, on a packet by packet
basis, to the proper port for forwarding. Thus they don't have to
know anything about frequency pairs or speed changes. All they
needed to know was a digi path list. Now that's mostly obsolete
thanks to the Netrom support in later versions of the code. The
user sees what looks like a normal Netrom network and again has
all the implementation details hidden from him. The user running
TCP/IP has it even better. He doesn't have to know anything but
the target host's name to use the network. Keeping the network
transparent to the user is very important if naive users are
to be supported. Hiding routing decisions in the switches means
that users don't have to depend on ad hoc routing tricks that
may change over time. As a switch maintainer, you can change

the way the network is configured at will while still keeping
it looking the same to a user.

At a hamfest last weekend I saw, at the Ramsey electronics table, a TNC
kit. This TNC is designed to connect (and get its power from) the serial
port (think it was the serial port, it's been a few days ago!). "No
adjustments, all feeqs are crystal referenced", "platform for 'poor man's
packet'". price: $60. connects to radios and HTs.

Anyone buy and build this thing? Any good? for the money?

Hello,
     I'm trying to find a working port of KA9Q to
     Unix for a month now... I need it to support
     SLIP (hopefully with compression), PPP and
     AX25 (of course :-).

     I've seen "unixnet.cpio.Z" from ucsd.edu: it's nice,
     but extremely limited. And it's dated 1989/1990...
     So I made sure it compiles fine, and doesn't crash
     when invoked, but since it doesn't support PPP and
     C-SLIP, it won;t help me greatly...

     "nosunix-all.tar.Z" from <don't remember> seems to be
     a full-blown port, BUT... I can't get it running! It
     barely compiles (after several fixes), and then I've
     no way to debug it, it simply crashes with memory
     fault immediately after being invoked... I'm not
     very skilled with GDB, and it's too big for DBX.

     I'm trying to do this on AIX/PS2 v.1.3 and on ESIX
     Rev.D (Unix SysV.3.2/386)...

     Any help is APPRECIATED!

If most of the users in an area are 1200 bps, as is the case everywhere in the world right now, then 9600 bps links are more than adequate between nodes and services (services being BBSs, callsign databases, tcp routers, etc).

When the 9600 bps users (users, as opposed to network infrastructure) become a significant segment of the population, then the links between nodes and services have to be higher speed to avoid congestion. The next logical step above 9600 bps is 56kb.

It is clear to me that simplex packet can only work in very small cells where every user can hear every other user. Unless you design a network in that way, the collision-retry nature of the channel will guarantee throughput in the slow snail category.

A full-duplex repeater solves that problem by completely eliminating the hidden-terminal problem, and thus resolves a goodly amount of the collision congestion. It also avoids the incredible waste of bandwidth that digipeaters and net/rom nodes represent.

One high-level repeater can serve a very large area. However, in my view, it is better to have small regions (perhaps a town or community) served by a low-level repeater through which all local packet stations would communicate, coupled with a network interface that connects to a central multi-community high-level repeater used only for the regional systems to communicate.

Making the community repeaters 1200 bps (and dual-speed with 9600 bps as well) means that the users don't have to do much except learn how to operate the offset switch on their radios. Making the central hub repeater operate at 9600 bps ensures that there is sufficient bandwidth for inter-regional communications, and it resolves the difficulty of making the 9600 bps stuff work by leaving it to the technical teams who build the repeater.

Yes, it's a significant investment in network infrastructure. Perhaps more important is that it's a significant investment in cooperation, which hams have never been real strong on. But it will work WELL, far better than the ham packet networks in place in 90% of the world now.

I think we ought to try it. If I have the chance to re-engineer the San Diego metro network, this is the way I'm going to go.

Sometimes you can't see how to do things right until you've tried other methods. But that's one of the biggest parts of ham radio: experimentation.

Subject: PK-232 vs MFJ1278 (opinions wonted)
Date: 20 Jan 93 17:21:40 GMT
Organization: UCSD Usenet Gateway
Lines: 62
Message-ID: <9301201751.AA22332@ucsd.edu>
NNTP-Posting-Host: ucsd.edu
Originator: daemon@ucsd.edu

Hi all,

Some time ago I decided to by new all modes TNC. After short searching
it looks there are only to models to consider: PK-232 and MFJ-1278.
There is very hard to choose especialy that it will not cost a couple
of bucks... I am not very experienced on this field so I do rely on
opinions of other packet friends.
I tryed to compare PK and MFJ by myself but it seems to be difficult.
Here are some remarks:

Prices are easy to compare. Well, Pk-232 is about 70 $ more expensive then
MFJ-1278. Let's try to find reasons of it.

There are of course a lot of PK's advantages which I think result from a long
presence of AEA on a market (14 years!). There is very good service support,
long list of distributors, well developed user friendly software (with some
exclusive commands). AEA also takes care of easy to operate front panel
design, all necessary cables and connectors are always included. And the most
important. There are over 50 000 PK in use around the world. It looks like a
standard...

We all apreciate these features but I think the most important are technical
differences.
As we all know good selectivity is what we need when chasing DX in poor
conditions.
Here are two descriptions. Which one is right, maybe both? If both which one
unit is better? Maybe I am trying to compare here an elephant and
a toothbrush???

AEA:
"... The PK-232 has no compromise VHF/HF/CW modem with eight pole Chebyshev
bandpass filter folowed by a limiter discriminator with automatic treshold
correction. (...) can be configured for optimum performance with different
types of signals. ..."
"... One multi-mode contoller offered by another (probably MFJ) uses no input
filtering on any mode. ..."
"... While another manufacturer does offer selectable modem setings for
different types of signals in their multi-mode controller, shortcuts in modem

design limit the filter's performance. ..."

And MFJ:
"... MFJ-1278 is the only multi-mode with a true DCD circuit. This dramatically reduces sensitivity to noise and dramatically increases completed QSOs. ..."
"... Tests in Packet Radio Magazine prove the modem used in the MFJ-1278 copies HF packet more accurately than all other modems tested. ..."

Looks great but there could be only one THE BEST! Any opinions welcome!

PK offers exclusive Packet Lite and mailbox which can be accesed in AMTOR as well as packet. But PK-232 does not offer SSTV. AEA asserts that this type of modems is not able to provide satisfactory SSTV performance. They advise to buy separate modem...
Is there anybody who can tell something about MFJ-1278's SSTV?

I know that high speed modems can be conected to PK-232 but what about MFJ? Is there any way or possibility to connect PSK modem to one of these units?

There are a lot of PK-232 users but I want to consider opinions of MFJ-1278 defenders also. Any advise can help me to make up my mind...
Thank you in advance,

73 de Greg, SP1WSN

Does anyone know of a version of KA9Q NOS which will allow the
output to the PC screen (eg. hop check tracing, icmp status) to be
redirected to a file?

I am helping to get NOS set up for teaching purposes and
want to be able to print out the screen info. I am
currently running JNOS105.EXE which is KA9Q NOS version
911229, Johan Reinalda WG7J/PA3DIS on 2 XT's. I have found the
trace command useful as it allows tracing to be stored
in a tracefile, but am wondering if any other commands

can do this or any other versions of NOS.

Thanks in advance for any help.

Not to sound like a Clueless Appliance Operator(TM), but why take the
trouble to assemble a kit when you can buy what sounds like the same
thing from Tigertronics for about the same (actually, a few $$$ LESS)?

My money is on the PK232. I've owned both, and the PK232 is far superior
on CW reception (not what you may use it for, but you never know). Also,
AEA has a history of continually updating the firmware for the unit since
it came out. Not the MFJ doesn't, but I've been less than impressed with
my dealing with the MFJ customer service department. Also note that
Kantronics makes an all-mode (KAM) which you should also consider. It's
smaller in size than the PK232. I don't have experience with the KAM but
I am very impressed with my KPC4 dual port modem. Good luck and happy
hunting, hope this helps.

Just about any version of NOS will allow you to record session output
with the record command. After you start the session, hit F10 and
type "record savefile" where savefile is the name of the file. To turn
it off, use record off, and to check use just record. Caveat: You can
only tell it to record after you start the session, so you tend to miss
the beginning resolve :)

Tracing can be done to a file instead of the console by specifing the
file after the trace parameters.

>Anyone buy and build this thing? Any good? for the money?

I have the Ramsey packet modem. It is basically the same design as
you see that comes with the Baycom software... a TCM3105 modem chip and
a CMOS buffer to bring the serial RS232 lines down to TTL levels.
I couldn't get mine to work in the Baycom mode... the Baycom software
comes with a warning (in poorly translated from German English) that
the Baycom software won't work with all serial UART chips (in your PC).
It didn't work with mine (a Goldstar 386sx machine), *but* to the credit

of Ramsey, they also provide a simple alternate wiring diagram to interface the modem to your parallel port for use with Poor Man's Packet software (which they *don't* provide... you can hunt it down on the net if you have access). The Baycom software is supposed to be better to use, but I have been satisfied with the PMP software, and the PMP software C source is also available, whereas the *Baycom* software source code is *not* available.

All in all, I would probably either *build* a TCM3105 modem of my own rather than pay Ramsey $60 for it *or* buy a PK88 for $100 rather than buying the Ramsey kit. The TCM3105 chips are available for $15 or so from Arrow Electronics (St Louis) among other places, and circuit diagrams for the Baycom and PMP designs are available. You might still be able to get a hold of a PMP *kit* for around $30-$40 from Kevin Feeney at Cornell (one of the PMP authors). Powering the modem from the serial line is a perfectly valid thing to do... the RS232 spec rates the lines at 500 mA with the ability to survive shorts, but if you can't get it to work with your serial port, it doesn't make much sense to tie up a serial port *just* for power... I wired a 9V battery connector behind the 5V regulator and can get buy for at least a week or more on a battery (use rechargeables).

Oh, yes. Connecting to the HT was something of a hassle, but mostly because I was having trouble with the serial line not working properly to activate the PTT, so I didn't recognize it. I was able to connect my Standard HT to the signal lines directly (PTT & Mic/Spkr).
My HT also works with the "Yaesu/ICOM" configuration which is described in the back of the AEA PK232 manual with our club's PK232. AEA also offers custom cables for connecting HT's to their TNC's which is another advantage of going that route. TNC's also have features like mailbox and can take messages in standalone mode with the PC off or disconnected.

(One drawback of the PK88 is that it has some birdies in 2 meters which can interfere with communications.)

Good luck!

>   -Steve

I think the Tigertronics unit is for the Baycom package. The Ramsey is for
PMP (Poor Man's Packet). Same idea but different and (I think) not
compatible.

On the other hand, you can find 'real' TNCs in the $60-75 range that will
have lots more features than either of the above. Look for a PK-88 or MFJ
1270B, among others.

G> Looks great but there could be only one THE BEST! Any opinions welcome!

G> 73 de Greg, SP1WSN

Hi Greg, To me this one is EASY. Having tested both in many different situations, buy the PK232. But I am not sure how the Kantronics KAM lost out to the MFJ 1278. I would buy a KAM everytime over a MFJ.

The PK232 copies packet as good if not better than anything I have tried. It works well on Amtor and RTTY but could use a narrower LPF. This can be changed BTW with a few resistor changes. The HOST mode software on the PK232 is what makes it the overwhelming winner in a MFJ to PK comparision.

I'm helping some friends who are moving to Western Samoa get connected for e-mail there, and I'd like to find out if it's possible to do it via packet radio.

Does anyone know whether packet radio is used among the islands in the South Pacific?

I got a list of "ampr.org" nodes from netfind@archie.au and compared the

names to a list of DX callsign prefixes, but the only South Pacific ones I could find were VK's (Australia)-- probably too far from Western Samoa to make effective contact directly. But if there are nodes on the islands in between, perhaps it might work.

Can anyone give a clue about how to find out where there are packet nodes in the islands?

Good morning. It's Sunday the 24th of January and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- A new way to hear the GB2RS main news bulletin; a statement regarding RAEN Limited; and the RSGB's phone numbers are changing.

And we start this week with news of a new way you can hear the GB2RS National News: The RSGB is making the GB2RS National News available by telephone for an experimental period using a premium line. The news bulletin will normally be available to callers in advance of the regular Sunday broadcasts, usually from a Thursday evening. The service should be particularly useful to those who are not able to receive the scheduled broadcasts every week. The bulletin is accessed by calling 0336 407394. Further information services are planned, including the local GB2RS bulletins but these will be implemented only if this initial experiment is a success. If you have any suggestions for additional services, please send them to Nigel Roberts, G4IJF, via RSGB HQ. I'll repeat that number: 0336 407394 and please note that calls will be charged at 36 pence per minute at cheap rate and 48 pence per minute at all other times. A proportion of the proceeds will go to the RSGB.

The following announcement has been made by the Council of the Radio Society of Great Britain regarding the affiliation of Radio Amateur Emergency Network Limited. The application by the Radio Amateur Emergency Network Limited to affiliate to the RSGB was briefly discussed at the January Council meeting, and in accordance with standard practice for application from national bodies, was referred to the Chairman of the Membership Liaison Committee. He has informed the President and the Company Secretary that there are important points in this matter which he wishes Council to discuss, and has requested that the matter be placed on the Agenda of the February Council meeting. No licence or permission for the use of the Raynet logo is granted to any group other than as stated on page 8 of the January issue of Radio Communication. From next Thursday the 28th of January all Potters Bar five-digit telephone

numbers will have the number six added the beginning of the existing numbers. This affects all RSGB HQ numbers, including the general enquiry number which will become 0707 659015.

The Goole Radio and Electronics Society has reported the theft a week ago of the following equipment: a Yaesu FT730R serial number 3C060105, a Yeasu FT230, serial number 4C220005 and a Cleartone Commando four metre FM rig, crystalled for 70.35 and 70.375MHz. Anyone who is offered any of this equipment or knows of its whereabouts is asked to contact the Secretary Richard Sugden, G0GLZ, on 0405 769968.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Pitcairn Island, VK4CPU and WK3D will sign VR6BB and VR6JJ respectively from early January until March, the exact

date depends on transportation. They will be on all bands 6 to 160 metres using CW, SSB, RTTY and FM. From Kampuchea, PA3BTQ will sign XU6TQ until the end of January. Check 14.050 or 21.050MHz on CW and 14.315 or 21.315MHz on SSB. From Turkey, DJ0UJ will sign TA2BK on 10 to 40 metres, especially the WARC bands. From the British Virgin Islands, W2GUP will sign VP2V/W2GUP from now until early March on CW only, mainly on the WARC Bands. From Tonga, A35CT hopes to be active for the next 2 to 3 years, check 14.219MHz at 0530GMT.

Rally news now and we know of two events for today Sunday, the 24th:

The Lancastrian Rally is being held at the University of Lancaster. Doors open at 10.30 for disabled visitors. The Oldham Amateur Radio Club's Mobile Radio Rally is being held at the Queen Elizabeth Hall, Civic Centre, West Street, Oldham. Doors open for Morse Test participants at 1000am, for Disabled visitors at 1030 and at 1100am for all others. There are catering facilities and ample car parking. Talk-in on is channel S22 from 0900am using the callsign GB4ORC. We know of no rally scheduled for next weekend, Saturday the 30th and Sunday the 31st.

Next a date for your diary:

RSGB'93, the RSGB's National Amateur Radio Show, takes place on Sunday the 16th of May at the National Exhibition Centre near Birmingham. There will be the usual large trade show plus many stands showing the RSGB at work. Further details can be obtained from the organiser Norman Miller on 0277 225563.

Next some HF Contest news:

The RSGB LF Cumulative Contest sessions take place as follows: The 3.5MHz session is today Sunday the 24th, from 1600 to 1800GMT. The 1.8MHz event is scheduled for Thursday the 28th, from 2000 to 2200GMT. And the 7MHz event is on Sunday the 31st of January, from 1000 to 1200GMT. For further details see page 62 of December's edition of Radio Communication. The CQ World Wide 160 Metre DX contest will take place between 2200 on Friday the 29th, to 1600 on Sunday the 31st of January. Further details can be found on page 12 of January's RadCom.

Now the VHF Contest news:

The first of five 70MHz Cumulative Contests is today Sunday the 24th, from 1000 to 1200GMT. The next one is scheduled for next Sunday the 31st of January. For further details see December's RadCom page 61.

Four Midlands VHF repeaters are currently running on timeswitches to restrict access to the daytime. This does not prevent their use at other times by any amateur radio emergency organisation when assisting user services in a genuine emergency.

And now the solar factual data:

The more active side of the sun has been looking our way during the period 11th to 17th January. This has been accompanied by an improvement in HF band conditions, though there was little flare activity. Magnetic activity has been

very unsettled. There have not been any significant flares, the only one reported being an C9.2/1F on the 13th. Spot counts have generally declined and meaned about the 100s. Solar flux levels also declined from 141 units on the 13th to 126 units by the 17th, with the period averaging 133 units. The geomagnetic activity was very unsettled being up to sub storm on the 11th and 14th. This was due to disappearing filaments and the passage of coronal holes. The effects of the storms were mainly in the northern latitudes. The geomagnetic Ap index averaged 16.2 units, with K levels up to K6 on the 11th, and K4 most other days. The state has been nil throughout the period, nothing to report except the magnetic activity at high latitudes. The radio quality indices improved slightly every day and were in the top of the normal band by the 17th. There were no poor circuits but the Tokyo circuit was up to very good on a number of days. The aa indices, as supplied by the British Geological Survey for the 5th to 11th of January, gave daily averages of 33.3 nanoTeslas, about K3, with afternoon periods of 102 nanoTeslas on the 7th and 11th, about K5. There was no quiet day. Bartells rotation 2178 started on the 13th of January.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, did not vary much over the period and averaged 9.9MHz, except for the 11th which reached 11.3MHz. The darkness hour lows averaged 2.5MHz and did not vary much day to day. The lows occur around 0600 hours daily but the highs vary between 0900 hours up to 1100 hours.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 9.4MHz, and the darkness hour lows 2.6MHz. Flares are classified in X-ray energy range starting at type A, through to C for the lower energy ranges, with the M and X for the higher ranges. This is further classified with a number 1.0 through to 9.9. The accompanying optical classification starts at importance 1 up to importance 4, with the brightness as F for 'faint', N for 'normal', B for 'brilliant'. The flare reported this week was a C9.2/1F, which means it was a medium range flare with a faint optical brightness.

And lastly the solar forecast:

This week, the quiet side of the sun will be looking our way this week so geomagnetic activity is expected to be quiet. HF band conditions are expected to be normal with MUFs up to 30MHz during the day light hours and 18MHz for the darkness hours.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S Y and G7 N Y series, and Novice calls in the 2 0 A E and 2 1 B J series. .

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Frequently Asked Questions for Amateur Packet Radio

Version 1.11 - Last modified 1/21/93

This document is for unlimited distribution.

Please send corrections and additions to:
   packet-faq@uts.amdahl.com
Which will expand to a list of people who are familiar with most packet issues. I hope. ;-)

The Packet Radio FAQ's will be posted on a monthly basis to rec.radio.amateur.packet. The current version of this document is available via anonymous FTP at ftp.cs.buffalo.edu.

Table of contents:

1 Basic Packet Radio Information
   1.1 What is packet radio?
   1.2 What is amateur radio?

1.3 What can I do on packet radio?
1.4 Why packet over other digital modes?
1.5 What elements make up a packet station?

3.1 Are there any other protocols in use other than AX.25?
3.2 What is TCP/IP?
3.3 Networking Schemes
What are some of those other networking schemes?
Digipeaters
KA-Nodes
NET/ROM
ROSE
3.4 BBS message transfer

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small bursts, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly

frequently asked questions posting in rec.radio.amateur.misc. A copy of that FAQ is also available from ftp.cs.buffalo.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than just your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes:

transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used as a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller): A TNC contains a modem, a CPU, and the associated circuitry required to convert between RS-232 and the packet radio protocol in use. It assembles a packet from some of the data on the serial line, computing an error check (CRC) for the packet, modulates it into audio frequencies, and puts out appropriate signals to transmit that packet over the connected radio. It also reverses the process, translating the audio that the connected radio receives into a byte stream on the RS-232 port.

Most TNC's currently use 1200 BPS (bits per second) for local VHF and UHF packet, and 300 BPS for longer distance, lower bandwidth HF communication. Higher speeds are available for use in the VHF, UHF, and especially microwave region, but they often require unusual hardware and drivers.

Computer or Terminal: This is the user interface. A computer running a terminal emulator program, a packet-specific program, or just a dumb terminal can be used. For computers, almost any phone modem communications program can be adapted for packet use, but there are also customized packet radio programs available.

A radio: For 1200 BPS UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 BPS data is used over single side band modulation. For high speed packet (anything greater

than 1200 BPS), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access). If you need to transmit, your TNC monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the TNC keys up the radio, and sends its packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the sender's and recipient's amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format 44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AX.25 - Amateur X.25 protocol. The basis of most packet systems. See section 1.7 for more information.

CRC - Cyclic Redundancy Check. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier frequency different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

modem - MODulator/DEModulator. Converts the analog signals into a binary data stream (a series of ones and zeros) for the TNC or a micro-computer. First step in decoding packets. It also converts binary data to analog, which is the last step in encoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

PPP - Point to Point Protocol. PPP is another protocol used for moving IP frames over a serial line. It supports host authentication, and non-transparent serial lines. It also has a standard way of negotiating header (and potentially data) compression over the line. See also SLIP.

protocol - A standard used for intercommunications between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

SLIP - Serial Line Internet Protocol. A trivial protocol for putting IP frames over a serial line to do (potentially) cheap TCP/IP networking. Approximately the same as KISS, except over wireline networks. See also PPP.

SSB - Single Side Band. The radio modulation scheme used for HF packet and satellite packet communications.

TAPR - Tucson Amateur Packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -ed]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

> Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio

rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

> I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be passed FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to ensure that rules of message content are followed.

> It's my license if I use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensee's responsibility, one illegal message sent over the packet radio network could literally jeopardize the licenses of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

> I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup): General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup): General amateur radio discussion. Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup): Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with policies of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup): General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

ham-policy@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (Mailing list): Group discussion of technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (Mailing list): Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

For all lists at ucsd.edu, archives may be found via anonymous FTP at

ucsd.edu. Some listserv groups also have archives. Send the command 'help' to the group's listserv for more information. Digest mailings for the ucsd.edu discussions are also available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

2.2 What anonymous FTP sites are available for getting packet radio information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu

Primary distribution site of KA9Q's derived TCP/IP packages. Also, general packet radio information in the /hamradio/packet subdirectory.

wsmr-simtel20.army.mil

Very large collection of amateur radio software.

wuarchive.wustl.edu

Mirror site of Simtel20 archives. Unix directory structure, which is easier to use then the simtel20 archive.

ftp.cs.buffalo.edu

Supplimental archive site for amateur radio information. Contains current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov

Packet software including Baycomm, ROSE, G8BPQ, NOS, etc.

akutaktak.andrew.cmu.edu

SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
SoftKiss is an init/cdev/driver that allows a MAC to do packet using a Poor Man's Packet modem.

sumex-aim.stanford.edu

NET/Mac is the port of KA9Q's NET program. It doesn't have nifty features like scrolling or saving the windows, but the individual sessions can be recorded into a file.

2.3 How do I contact the ARRL via electronic mail?

There are various addresses at ARRL HQ, but the most important one is probably info@arrl.org. That is where general information about the ARRL can be acquired. This address reaches a person, so you'll have to specify what/who you're looking for.

2.4 Are there any gateways for mail or news between Internet and Amateur Packet radio?

Internet / Packet Radio BBS Gateway

Jim Durham, W2XO, maintains a gateway between Internet and the Packet radio BBS system.

To mail from Internet to Packet:

1. Mail to: "bbs@w2xo.pgh.pa.us"

2. Make the first line of the text a Packet BBS "send" command, ie: SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the Internet mail becomes the "title" line of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message sent FROM Internet TO the Amateur Packet Radio BBS system. Messages should be of minimal length and appropriate content. Read Section 1.9 (Do's and Don'ts: Rules and Regulations) regarding appropriate usage of packet radio for more information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in the gateway alias list. If you want to mail from packet to a specific amateur on Internet, send mail to 'durham@w2xo.pgh.ps.us' (Internet) or 'W2XO @ W2XO.#WPA.PA.USA.NAOM' (Packet BBS mail) with his/her amateur callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NAOM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.ps.us'.

LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These

gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if its call was in the digipeater field, would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections with fewer timeouts, because acknowledgments are only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM station as if connecting to any other packet station. From there, he can issue commands to instruct the station to connect to another user locally or connect to another NET/ROM station. This connect, then connect again, means that to a user's TNC, you are connected to a local station only and its transmissions do not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM doesn't use all of the AX.25 protocol. Instead, it uses special AX.25 packets called Unnumbered Information (UI) packets and then puts its own special protocol on top of AX.25. This is again used to increase efficiency of its transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network. However, if band conditions such as ducting occur, ordinarily unreachable nodes can be entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

ROSE is another networking protocol derived from X.25. Each ROSE node has a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that, the network is completely transparent to the user.

ROSE's use of static routing tables ensures that ROSE nodes don't attempt to route packets through links that aren't reliably reachable, as NET/ROM nodes often do. However, ROSE suffers from the inability to automatically update its routing tables as new nodes come online. The operators must manually update the routing tables, which is why ROSE networks require more maintainance.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBSes use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBSes, many TNC makers have developed Personal BBS software to allow full service BBSes to forward mail directly to the amateur's TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

The servers you mentioned won't help this guy answer
his question about old callsigns from the 60s and 70s.
The data doesn't go back that far but I wish it did.

None of my old callsigns are listed on the servers and
I've been licensed continuously since 1965 (WN2TQK, WB2TQK,
WD9CQM, ...) .

Also, some people *incorrectly* assume that you can tell how
long a ham has been licensed from the data on these servers.

In this month's QST, AEA has a full page ad for their new PK-900.
It claims to do it all, including sharp greyscale FAX, memory ARQ,
true DCD state machine, true dual port, and optional 9600 baud modem.
This all in addition to the normal AMTOR, RTTY, Packet, and CW that
the PK-232 has. The ad says it uses 3 microprocessors, and the picture
shows a snazzy LCD front panel.

Gary

Hello,

I just purchased a Kantronics kpc3 tnc and am having trouble getting it
fired up. I issue a connect request, and the XMIT light illuminates
periodically, then eventually times out. The xmit light on my yaesu handheld
never lights; the book suggests that the tnc/HT cable might be bad.

Here's the sticky part: this cable came unassembled, and I had to connect a
DB-9 connector, 0.1uF cap and 2.2K res on one end, and the 2 mini-plugs for
the HT on the other end. I've retraced my connections, and I just can't find
a mistake, but I'm always quickest to blame my own handiwork. :)

Could the wiring picture be slightly wrong, e.g. the picture's bigger plug is
actually the little plug, etc. ??   Any suggestions are welcomed.

I suspect a "documented wormhole" would be called a "gateway". :-)

Hi AMPR folk,

Together with TCP/IP, KA9Q/NOS ... I often read the word SLIP.

I couldn't find an explanation in the recent FAQ-file!

Is anybody out there who can explain me SLIP?

Thank you in advance,

Good morning. It's Sunday the 3rd of January and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

Listeners may remember that for many years we presented a retrospective GB2RS bulletin at this time of year. Unfortunately, staff resources have not been available to do this in recent years. To the rescue has come GB2RS news reader Vic Kusin, GM4HCO, who volunteered to provide his own GB2RS highlights. Here, then, is his review of the past year in amateur radio, as we reported on GB2RS:

We started the year with congratulations to RSGB Member Sir Brian Rix, CBE, G2DQU who was made a Life Peer in the 1992 New Year Honours list in recognition of his work for the mentally handicapped. The first meeting of the new RSGB Council took place in January at Bangor, Northern Ireland, where Peter Chadwick, G3RZP, was elected Executive Vice President for 1992. At a ceremony at Bangor Castle, Terry Barnes, GI3USS, was formally installed as President of the Society in the presence of the Lord Mayor of Bangor. Extracts from the GB2RS broadcast of the 12th of January were read out over Television and Radio in Northern Ireland to promote amateur radio and the Society. Stations in Finland used the prefix OG instead of OH during 1992 to celebrate 75 years of Finnish independence and stations in Cyprus used the prefix P30 during January and February for the 30th anniversary of amateur radio in Cyprus. Kenya signed a reciprocal licensing agreement with the UK. The Society produced an information booklet 'A Closer Look at the Novice Licence' which put the RA's Novice Licence terms and limitations booklet into simple language. Copies are available from RSGB Headquarters. The Radiocommunications Agency released an information sheet: Advice on TV and Radio Reception, form RA179. This gives helpful advice, sets out procedures to be followed and includes a complaint form. Copies are available by telephoning the RA Library Service on 071 215 2072. The beacon GB3LER, located at Lerwick in the Shetland Isles returned to service on 50.064MHz after having its aerials damaged during a severe gale in December. This beacon, operating on 6 and 2 metres is an important auroral warning indicator.

The month long ITU World Administrative Radio Conference, WARC'92, started on the 3rd of February in Torremolinos in Spain. The RSGB's representative on the UK delegation was David Evans, G3OUF. John Allaway, G3FKM, was also at the conference as part of the IARU observer team. The conference was opened by Her Royal Highness Queen Sophia of Spain, who was familiar with the Amateur Service because King Juan Carlos of Spain is licensed as EA0OLC. This major International Telecommunication Union Conference attracted over 1200 delegates

from some one hundred countries. At least ten countries attending the conference, including the United Kingdom, had licensed amateurs as delegates. OSCAR 14 was taken out of service on the 17th of February to be replaced by OSCAR 22. The Pacsat handbook which fully describes the operations of OSCAR 22 is available from AMSAT-UK. The special callsign 4G2VOA was used from the Philippines during February to celebrate 50 years of broadcasting by the Voice of America. A new 2 metre repeater came on the air in Scotland. GB3LG, on channel R3 is located at Lochgilphead, Argyll. The Girl Guides Association's Thinking Day on the Air took place on the 22nd and 23rd of February. The event is run on the weekend nearest to the birthdays of the founders of the Guide Movement, Lord and Lady Baden-Powell. In the UK some 172 stations took part, and during the event the Guides were able to exchange greetings messages with some 36 countries world-wide.

March saw the ending of the WARC'92 Conference without the expected change being made to the 7MHz amateur band. The alignment of this band on a world-wide basis will be discussed at a later date. The 2.3GHz band, which is allocated on a Secondary basis to radio amateurs, will have to accommodate other services in the future which raises the question of sharing. Wind profiler {newsreaders, this is wind as in weather, not as in wind-up} radar, which concerned frequencies around 50MHz, 400MHz and 1000MHz was referred back to the CCIR, the ITU's technical advisory committee, for further study. The International Amateur Radio Union participated in a Project aimed at establishing amateur radio in Korea. The authorities of the Democratic People's Republic of Korea indicated their positive attitude towards such an initiative. After 67 years, the final scheduled transmissions from the historic BBC HF transmitting station at Daventry, Northants took place on the 28th of March. To mark the occasion, GB67XX operated on the HF bands for a few days after the closedown using some of the large broadcast aerial arrays. Sergei Krialyov, the cosmonaut who travelled with Helen Sharman to the Mir space station, returned to Earth after a year of providing frequent amateur radio activity from the space station. This did not, however, leave space without an amateur radio presence as the NASA Shuttle Atlantis lifted off on the 24th of March with a crew particularly rich in radio amateurs.

The RA announced that from the 1st of April 1992, UK Class A licence holders could use 26dBW, 400 Watts, PEP output power from 1.830 to 1.850MHz. This was a direct result of negotiations with the RSGB. In commemoration of the April opening of the Euro Disney Resort near Paris, the Disney Amateur Radio Clubs operated five Special Event Stations at Disney sites in the USA, Japan and France. On Sunday the 12th of April, RSGB member Mike Costello, G3YPP, completed the London ADT Marathon in 4 hours 31 minutes and raised a substantial sum towards the RSGB Mencap Albania appeal. The West Midlands Raynet Group was asked to return to Romania, following their earlier expedition with the Yorkshire Dales Relief Team. Raynet provided essential communications for the teams of relief workers who were renovating and equipping 27 medical centres in the same region. A new RSGB award was introduced. The 50MHz Transmitting Award requires confirmation from 40 counties and 12 countries on 50MHz. For the Senior Transmitting Award, 60 counties and 20 countries are needed and this certificate counts as credit towards the RSGB Supreme Award. Information and application forms may be obtained from the RSGB VHF/UHF Awards Manager, Ian Cornes, G4OUT. The major event at the end of April was RSGB'92, the RSGB National Convention and

Amateur Radio Exhibition at the National Exhibition Centre near Birmingham. The centre-piece of the event was a diamond-shaped village of RSGB stands. In addition to the trade and flea-market areas, there were lectures on a variety of subjects, from 'Propagation' by Jim Bacon, G3YLA to 'The Future of Raynet' by Geoff Griffiths, G3STG. On the Saturday there was an all-day Packet Radio Seminar. Traditionally, the 'RSGB Show' has become a meeting point for many national amateur radio organisations.

In May, the RA announced a Reciprocal Licensing Agreements between the UK and Malaysia, and between the UK and Sri Lanka. In a massive auroral opening on the 10th of May, RSGB VHF Manager Dave Butler, G4ASR, made 146 CW contacts on the 144MHz band, with 66 locator squares in 17 countries. Many of his contacts were around 2000km. World Telecommunication Day was celebrated by member countries of the International Telecommunication Union on the 17th of May, coinciding with the date of signature of the first International Telegraph Convention in Paris in 1865. The Geneva station 4U7ITU was active on all bands. The Council of the RSGB issued a statement regarding the reorganisation of Raynet, emphasising how important it was that liaison and support should continue between the RSGB and all those involved in this public service aspect of amateur radio. The RSGB would, for the present time, provide insurance cover for all involved in this aspect of amateur radio, whether or not they are members of the Society. From the 29th to the 31st of May the 50MHz band produced double hop sporadic E openings to Turkey, Cyprus and Israel from GJ4ICD in the Channel Islands.

Two RSGB members were awarded the OBE in the Queen's Birthday Honours List in June: Past RSGB President Barney Patterson, GI3KYP, and Britain/s first astronaut Helen Sharman, an honorary member of the Society. The RSGB HF SSB National Field Day took place during the first weekend in June. The Open Section was won by the Reading and District Amateur Radio Club, G3ULT/P, the Restricted Section by the Gravesend Radio Society, G3GRS/P and the QRP Restricted Section by the Adur DX Club, G4BUE/P. Overall 93 groups entered for the contest. The RA announced that from the 1st of January 1993 the 12 Words Per Minute Morse Test will change to the QSO-type format currently used for the Novice 5 words-per-minute test. Both the current format and the new one will be available to candidates for the first three months of 1993, after which the new format only will be used. The RA announced that Ireland had signed the CEPT agreement TR61-01, which means that a reciprocal licence is not required by UK Class A and B licensees for operation in the Irish Republic. Novices are not included in this agreement. A widespread sporadic E opening on the 22nd of June affected the 50, 70 and 144MHz bands. On 50MHz the band opened to North America for 8 hours. During the 144MHz opening the RSGB's VHF Manager, G4ASR, worked 60 stations in Yugoslavia, 17 Italians and 12 Austrians as well as Poland, Hungary, Bulgaria and a Greek station at a distance of 2,400km.

In July Peter Kirby took up his appointment as the RSGB's new General Manager after many years in management, mainly in the Navy. One of his first duties was to attend the Society's Strategy Conference at Warwick University on the 10th and 11th of July. Around 100 people attended the two-day event which proposed marketing the Society more aggressively, a new category of membership for those with at least ten years' service, a bigger RadCom, a higher profile for affiliated societies, a members' help-line service and an investigation of

the pros and cons of a code-free HF licence. The aim of the conference was to plan for the next three to five years and it will be some time before all of the proposals can be fully discussed and costed. The first Novice licensee to receive an RSGB VHF/UHF/Microwave Award was eleven-year-old Alice Blackwell, 2E1AIZ, who claimed the 1.3GHz distance award for her contact with LA8OJ at a distance of 720km using just 1 Watt. A very Special Event callsign GB500GRC, Grand Regatta Columbus, was aired from the 21st of July celebrating the 500th year of the discovery of America by Christopher Columbus. This culminated in the Grand Parade of Sail at Liverpool, marking the end of a four-month voyage of the world's finest sailing ships. Peter Chadwick, G3RZP, was elected RSGB President for 1993. He takes up his appointment on the 1st of January. Armenia and Uzbekistan became Members of the ITU bringing the membership to 172. The AMSAT-UK Colloquium, the annual get-together for those interested in satellites, took place at the University of Surrey at the end of July. The event comprised lectures and demonstrations arranged to provide delegates, from beginner to the expert, with a complete educational and fun weekend with an opportunity to talk to those who design, build, command and launch the satellites.

August saw the 60th anniversary of the BBC's first venture into television when, in 1932 they took over responsibility for programmes previously broadcast by the Baird Television Company. To commemorate this, members of the Baird Amateur Radio Society used the callsign G2TV. This callsign, the first to be issued anywhere for television transmissions, was held by John Logie Baird from 1926 until 1939. A series of articles appeared in the press at the end of August regarding the so-called 'Diana Tapes', which caused widespread condemnation from the licensed amateur radio community over the use of the term 'Radio Ham' in the articles. The RSGB issued Press Statements explaining the difference between the hobbies of CB, scanning and amateur radio, and pointing out that the eavesdropper did not hold an amateur licence.

In September, the UK Amateur Radio Satellite UoSAT OSCAR-22 provided a humanitarian service in connection with the hurricane in the Hawaiian Islands. At the end of September over 200 DX amateurs from more than 30 countries attended the RSGB International HF and IOTA Convention. It featured talks on the RSGB's popular Islands On the Air Award programme as well as those from well-known personalities like Peter Hart, Mike Grierson, Peter Chadwick and Ross Clare, covering transceiver performance and construction, linear amplifiers and EMC. The UK DX Packet Cluster Group demonstrated how to use this DX Information system. Also at the HF convention, the RA announced its continuing support for Project YEAR - Youth into Electronics via Amateur Radio - with a further two years of sponsorship of the Young Amateur of the Year Award. This annual award goes to the most outstanding young licensed amateur and this year's winner was seventeen-year-old Martin Saunders, G7JCJ from Dorset, a keen computer enthusiast who operates a Packet Cluster node serving the local HF DX community.

The 35th Jamboree On the Air took place over the weekend 17th and 18th of October when Scouts and Guides all over the world used amateur radio to celebrate their shared interest. Some joined with the World Federation of Great Towers to put on stations at towers round the world, including Blackpool Tower, the Empire State Building, Centre Point in Sydney, CN Tower in Toronto, the Eiffel Tower in Paris, the Euromast in Rotterdam and the Telecom Tower in

London. The report on the June Novice RAE was published, showing a record number of candidates - 369. The City and Guilds attributed the 74% pass rate and high standard of candidates to the RSGB's "well organised training schemes and the standard of instruction and guidance given". A report on the May RAE mentioned a pass rate of over 81%, the highest for several years. It went on to say that "most candidates had an excellent understanding" of EMC. The report also expressed a hope that future candidates will gain more practical experience before sitting the exam. Tests of the RSGB's high power propagation data beacon, GAM1, proved to be successful thanks to all of those who sent in reports from all over the country. It proved necessary to apply for a new frequency for reasons of international cooperation and final approval is still awaited.

In November, Morag Howell, GM0MUV, was given permission by the RA to use the callsign GB4MSS/VP8 from her expedition base camp in the Patriot Hills, Antarctica. She is part of the Pentland South Pole Expedition in which Sir Ranulph Fiennes and Dr Mike Stroud are walking unsupported 2000 miles across the Antarctic. They are also raising money for the Multiple Sclerosis Society. The City and Guilds RAE syllabus had to be changed to incorporate the application of valves as RF power amplifiers, and their advantages and disadvantages. This is to bring the UK in line with other CEPT countries who are working towards a Harmonised Amateur Radio Examination Certificate which, when implemented, will enable a radio amateur to obtain a permanent licence in countries which have signed the CEPT agreement. The conditions of the Amateur Radio Licence and the Amateur Radio Novice Licence were amended by a new paragraph added to Note 1 of the Notes to Terms, Provisions and Limitations Booklets BR68 and BR68a/N. The original proposed paragraph was studied by the RSGB EMC Committee, who raised some areas of concern and, as a result, it was revised by the RA. The first year of the Novice Licence scheme was reviewed at a meeting between the RSGB, the RA and the City and Guilds. The RA felt the scheme had been a success and that only minor modifications were required. The high operating standard of Novices was a testimony to the effectiveness of the practical element in the RSGB's training scheme. Some minor changes to the examination syllabus were agreed and some small extensions to the band plan were proposed. It was felt that Novices should not have access to the two metre band as this provided the best incentive for them to upgrade to a full licence. No changes are to be made to the power levels. By the end of November, The Pentland South Pole Expedition was well ahead of schedule. Using their Yaesu FT70G transceivers, running 10W to a dipole, they had been in direct communication with Lawrence Howell, GM4DMA in Aberdeen. Morag, GM0MUV/VP8, reached her base station at Patriot Hill after being held up by bad weather. GM4DMA relayed the GB2RS News Bulletin to the expedition and it is understood that they were delighted to hear that we were following their progress.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Was I dreaming or did I here somewhere that there is a new version of
WG7J nos that utilizes XMS or EMS? I have looked for it on a number or
boards to no avail. Was it a dream?

You speak perhaps of the infamous SunOS ALM driver spl bug? Have you upgraded since 3.5? I've run SLIP on Suns running 4.0 and 4.1 without any problems, and under 3.5 with a 10 line patch to the kernel (no kernel source required). (In fact, I'm typing this in over a 38 kbps SLIP link between my Unix machine at home and a Netblazer at work.)

It doesn't really matter. In my case, the local end of the SLIP link (home) takes an address from the remote LAN subnet.

> TCP/IP requires seperate NETWORKS for the SLIP and Ethernet. This may
> be accomplished by subnetting. Subnetting amounts to carving up your
> Class Bnto multiple networks.

No. Some extremely broken routing software may require this, but IP doesn't. (Hint: if you're running a version of routed derived from 4.2BSD, replace it with something newer, or run gated instead.)

Statements like "I heard packet works better through a repeater" concern
me (not that you said that - I've just heard it before). One of the
potential strengths of packet is as a distributed, redundant system.
Adding a repeater greatly reduces collisions, but at a significant
expense:

- the repeater is a single point-of-failure, and
  many people will not be able to or know
  how to operate without it when the repeater
  dies
- repeater coverage rarely stays localized. After
  a while, a better antenna, more power, etc.
  and you wind up with a wide-coverage packet
  repeater that is jammed up.

A wormhole is a link from (say) the West coast to the East coast via
satellite or dedicated phone line. It is outside of the 'normal' world of
amateur radio.

In article <1993Jan2.183608.22342@fuug.fi> an4363@anon.penet.fi tells of
difficulties connecting a KPC3 to a Yaesu HT. I tried replying directly,
but it bounced, so for the benefit of all:

Call Yaesu @ (310) 404-2700. They can fax or mail you an app note that shows
what the cable should look like.   Looks something like this:

The mic signal should be about 100 mV rms, and not more than 300 mV rms.

This works with my Packet Mac Modem. I know nothing about the KPC-3; perhaps the problem is there?

Hope this helps.

Subject: NOS with 'baycom' TNC - recording problems
Organization: Wang Labs, Lowell MA, USA
Date: Mon, 4 Jan 1993 16:26:50 GMT
Message-ID: <C0C8Cq.9uL@wang.com>
Summary: Only records what I type, not what is received.
Keywords: NOS AX25 BayCom recording KA9Q packet driver problems
Sender: news@wang.com
Nntp-Posting-Host: bohica.wang.com
Lines: 35

I am using the June 3, 1992 version of net.exe (189,311 Bytes) with Pawel's (jalocha@vxcern.cern.ch) "... packet driver for BAYCOM modem to be used with NOS." (ax25drv.zip.23-nov-92 ftp'd from ucsd.edu) with the BayPac Model BP-1 (From Tigertronics, Inc.) (Thanks mom!)

It works great! My deepest thanks to the authors/contributors! I have been working with computers and networks for a decade and a half but this is still WAY COOL (and cheap)! The only problem I have encountered so far is that when I 'record' to a file, I only get what *I* type. None of what is received get's recorded, which is what I actually want to record (of course).

Is there a newer/better/preferred version to use in this case?
Am I the only one with this problem?
Did I mess something up?

BTW, The BP-1 shipped with a copy of the BayCom software. Despite great effort I could not get it (or the latest version available from SIMTEL20) to work without hanging. I did manage to connect one time and then it hung

immediately after the connect. I tried everything: shortening the cables, shielding the cables, remoting the antenna, operating on 1W, removing every possible piece of resident software, ... It would always hang in 'Sending'. It even hung without the 'mic' connection in the radio.

The documentation says that if it hangs it is almost ALWAYS because of RF getting into the device (or computer) or because of TSR's. There was a side note about problems with some systems running DOS 5 (guess what DOS I have ;-).

BUT!!! I was up and running in 1 hour with NOS and the AX25 packet driver!!! (and the crowd goes wild!!!!).

Subject: Problems with Icom IC-245 & Packet
Message-ID: <C0C5DD.18n@chinet.chi.il.us>
Summary: Help wanted
Organization: Abacus Computers - You Can Count On Us
Date: Mon, 4 Jan 1993 15:22:24 GMT
Lines: 52

OK, I'm having some trouble connecting my Icom IC-245 to my new TNC. Here are the details:

Equipment: AEA PK-88, IBM Clone, Icom IC245

Now, first off, the PK-88 and computer work fine. In fact, connecting them to my Radio SHack 2m HT works flawlessly. However, when using the Icom.....

Well, I have it wired correctly and I can connect to a local to me digipeater. However, it is very unreliable to connect to anything else. According to some locals who have monitored my transmissions, my transmitted packets look fine and the other stations are sending back packets, however, I don't receive them.

Yes, I do receive them, but on the PK-88, I get "Frame too short" errors. My PK-88 will try 10 times to connect, 10 times to other station will respond, my TNC receives but does not decode it, I get a "Frame to Short" error most of the time.

Now, If I wire the PK88 to xmit through the Icom, but receive via a scanner I have, all works well. Also, all works well with the one digipeater here in town. However, any other system does not work and I can seldom connect to them, and even when I do, I almost immediately get a "Disconnected: Time out, Retry limit exceeded" errors.

So, it seems something about the Icom's receive section does not work well with packet. Two theories have emerged among my local packet elmers:

1. The Icom 245 tx/rx relay is slow and after sending a "COnnect" packet, it can't get back in receive mode fast enough to hear the response. Possible the local digipeater has a delay set on it such that it keys the carrier, and waits a few milliseconds, and then sends out packets... perhaps even long for my Icom to switch to receive mode.

2. The Icom 245 Squelch is too tight/loose and does not release the squelch fast enough to get the first part of the packet through. Agin,

fits with the digipeater working and not others.

To test these ideas, tonight I will try monitoring the packet channel with the squelch off. If I see all the packets properly, then it looks like it will be 1. If however, on just monitoring, I get packets incorrect, it may be two or some other problems.

Does anyone have any suggestions, help, or advise they can offer? How about anyone using an IC-245 on packet?

   A wormhole is a long distance link between two stations using the same protocol. A gateway converts one protocol to another. A wormhole might use a gateway as it's communication link, or it could use a standard phone line.

Example:
    Wormhole: NET/ROM TNC in Florida connected to another NET/ROM TNC in Hawaii using a land line and modems. The user comes in one side using NET/ROM and goes out the other side using NET/ROM.

    Gateway: SMTP to AX.25 bbs message.

    Combination: Set up a wormhole using TCP/IP, AX.25 encapsulation as the link. Both users see AX.25 data, but a Internet/AX.25 gateway is used as the link.

It stands for "Serial Line IP". It's a protocol that makes a remote
machine linked over serial line to act like a machine that is linked
thru real ethernet.

According to my TCP/IP manual it stands for:
Serial Line Internet Protocol

It is (as the name implies) a method whereby a user can connect
to a given system via a modem/asychronous line and use the
system interconnections (network commands) as if you were
actually connected to the LAN. Needless to say, it is slower
than the equivalent hardware LAN connection, but is a _very_
handy way to access the power and resources of the net.remote.

>actually the little plug, etc. ??   Any suggestions are welcomed.

You are the grand prize winner! After checking the pin out of the plug
on the KPC-3
against my radio (a Yaesu HT), I discovered the the diagram showed the plugs
exactly backwards. I was so mad I showed my wife (like she cared) and
asked her
what she thought the diagram was showing. After losing one set of
plugs (it wasn't
worth desoldering), I was on the air. That is the only problem I've
seen so far however.
I love the unit although that is an extremely frustrating first experience.

>From: usc!elroy.jpl.nasa.gov!oak!laborde@network.UCSD.EDU
>
>Hmmm... Seems like Santa distributed some KPC-3s this year. BTW, does anyone
>know if the KPC-3 comes with the jumper (J-2, I believe, but the manual is not
>nearby) already set for the HT position? I have used it with my 3SAT and it
>seemed not to have a problem.
>
>Thanks,
>-Greg.

My unit was not configured for HT. If you have a screwdriver handy (as
opposed to the
manual) you can verify this because the jumper is actually labeled
"HT". I debated using
this myself but I switch it between a mobile and an HT. Changing the
jumper each time is
more difficult than just building that stuff into the DB-9 hood (just
keep the leads short).

My own question is how to make a cable for an Alinco DJ-580T. It has
that weird stereo
submini mike plug and I can't find a pin out for this guy anywhere. I
have heard there's
actually power in that jack however, so I'm not going to experiment.

Thanks,

Scott N7WLO

My recent experiences with the MFJ-1274 haven't been real fun. I hope someone can point me in the right direction.

First, i purchased the 2400 baud modem kit from MFJ and installed it according to the directions. This 1274 is fairly old, but it seemed to go in without a hitch. I fired it up and tested it on 1200. It worked fine. I switched to 2400 and started to monitor the local dx cluster. About the only thing on 2400 around here.

Nothing. I turned the trace mode on and watched gibberish come accross the screen.
Obviously, it is hearing something, but not what is being sent. There are no testing instructions in the manual that came with the modem. I went back to 1200 and it still works fine. Any ideas? I am still trying to find someone with a 1270/1274 locally that has the 2400 in it working so I can slip mine in and see if it is my installation or the modem.

2nd problem. I purchased 1.1.8a from tapr recently. I decided that maybe my 2400 baud problem might be related to the 1.1.4 version of the software that I was running, so I put the new ROM in. Well, it gets as far as lighting up the leds that are normally light up for a brief period after the power is turned on. They never go out and I never get a response on the com port.

My questions are:
Do I kneed 1.1.8a or at least something more than 1.1.4 to run 2400 baud?
Do I need to do something to the 1274 to be able to use the 1.1.8a software?
Will the tapr chip work in the 1274? I told the nice lady what I intended to put it in when I ordered it. If it wouldn't work, I would have thought that she might have know or maybe that was a poor assumption.

I am a fairly compentent technician, having built lots of things, both from scratch and from kits, including lots of computer related stuff. I know how to put chips into sockets and get them out without bending the pins too much. 8^) I even used a esd strap and bracelet when installing the ROM, but not the 2400 baud modem.

So, in a nutshell, do I have two independent problems? Is it all my fault for not consulting the stars before starting? etc.

Thanks for any help.
Please reply by email, since this isn't something I would guess is very interesting

to the rest of the earth. If anyone is interesed in the answers, drop me a note
and
I'll forward the results to them.

Jim.

   I've checked a couple of mods databases and can't find what I want.
I'd like to modify a TNC-2 clone (MFJ-1270B) for 10mhz clock speed. I
know that you need to upgrade the 4.x crystal with a 9.x crystal and
upgrade the Z-80 and SIO chip the the 10mhz version. What else do you
need to do? You've got to do something to have the on board clock and
TNC settings like TXdelay not also run at 2x speed. I think that the RAM
and ROM memory needs to be rated at a certain speed to work with the
faster clock.

   Also, I'd like to be able to use 512K eproms instead of the standard
256K eproms and be able to switch back and forth between the upper and
lower 256K banks. I think that this is possible. I'd like to burn the
lower 256K with a standard TNC-2 code and the upper with THE-NET or
ROSE or some other networking protocol. I'd then use a switch to select
the code I wanted the TNC to run. I think that it can be done, but I'm
not positive.

   If you've seen these mods for a TNC-2, please let me know. Thanks.

X-Subject: Re: tnc/ht woes

Hi again folks,

Re: problems wiring up the cable betw my kpc3 and my Yaesu ft-411 ..

After a lot of noodling around and finger-burning and cussing :), I got it
working. Mike kb2kyz suggested that I try a lower val resistor (470 ohms).
That, combined with using the *little* submini plug for the PTT stuff
(yes, the book's picture _is_ deceiving!! grrr..) did the trick.

I'm just concerned that maybe 470ohms is too low, and too much current in
either the tnc or ht might sizzle something.. I'll have to consult the specs
sheets to see if there's some 'max sinkable current' listed somewhere...

Thanks to all who volunteered their help!

dave kohn   n0ucf   agrans@vlsi4.d.umn.edu

An Answer

Rainer:

SLIP stands for Serial Line Internet Protocol. Basically, it's a protocol used for connecting two ip (Interrnet Protocol) based boxes via a dedicated or dial up serial connection. The boxes could be unix machines, routers, or chameleons such as the KA9Q NOS.

There is a SLIP protocol module built in to the KA9Q NOS.

So for example you could network two machines together by putting a null-modem cable between them and running SLIP protocol software on both machines. More likely you'd put (wireline) modems on the machines and allow them to network across some distance via ma bell.

PPP (Point to Point Protocol) is another protocol used for the same purposes, but with some additional features that make it more suitable for dial-up use.

A few questions

I am trying to set up dial-in and dial out SLIP on my KA9Q NOS box. On the dial in, I have one problem to solve, which is that I want the modem to hang up on the caller if there is no activity on the port for a few minutes. I don't think the NOS is equipped to do this. My solution so far is to bastardize the 'dialer' code to create a 'watcher'. The watcher watches for data transmissions and carrier status on a port. If CD stays true for XX time without any activity, it (depending on how ambitious I get) drops DTR fora couple of seconds or executes a hangup script.

I was wondering: has anyone else has approached this problem, and how did you solve (or fail to solve) it?

The other problem I'm having is generally related to using 'dialer' to dial a slip connection. First of all, all the docs I have indicate a different version of dialer than the executable. The executable is asking me for an interface, timeout, raise script, and lower script. I tried to use this but could not get it to dial or

generate any errors (once I has all the files in place and the flags set on the asy attach).

The port DOES work and I am able to tip out through it. I am going to try a manually initiated slip tonight.

All the docs I have talk about a dialer that asks for number of pings etc and uses one script.

I've been looking at the source and it seems to have been modified several times... The last mod was in mar '92 by PK.

Anyway, there are two things I am trying to accomplish re dialing:

1 - Keep a line up, ie dial a connection to another site and keep it going, redialing automatically if the link should drop. The version of 'dialer' described in my docs seems like it is written specifically for this purpose.

2 - Demand dial a line, ie when I try to send a packet through that port, if the connection is down it dials. If the connection should be terminated (ie ma bell gives up or the other side times out), my side does nothing unless another packet is sent. I was also thinking another that a timeout on my end would be nice, ie set a maximum time that my end will keep the connection going in the absence of traffic.

I have no idea whether there is anything written for NOS to do #2.

Another question: What is the difference between the current KA9Q release of NOS and the version maintained by PA0GRI?

Re: finger and fingerd
I am having a problem with finger where I can finger the NOS box from my unix box, and get the system info and a list of all 'users' ie files in /nos/cfg/finger (on my system \nos\cfg is passed to net.exe). However, when I try to finger a particular user it says 'user not known'. I was wondering if I am doing something really dumb. I also have those same users listed in my ftpusers file.

In the source I have, you cannot finger someone on your own machine. I was wondering if there is any reason why one couldn't modify finger to assume the local hostname where none is supplied. The finger session could then access fingerd on the same machine?? I could even see cheating by looking up the local ip address directly rather than requiring an entry in the hostname table. I was wondering if there is a KA9Q sockets or pre-emption caveat that makes this impossible. Is it not cool to connect to a socket on the same NOS machine in general??

Thanks! very much to all who have been helping me with this, and sorry! to the dozen or so who wrote to me asking for forwarding of information. I just can't get to all of you right now, but I intend

to summarize my whole setup and what I did to get it working as soon
as I DO get it working :) I don't want to spread misinformation...

I DO have it working on ethernet and I'm working on SLIP now, plus
trying to learn about all the various services NOS provides and how
to set them up. I don't have my packet modem yet... If you are
interested in talking about any of the stuff I've mentioned, feel
free to contact me via home telephone, 203-866-9515. This is the
only practical way to carry on a lengthy conversation with me right
now as I am very busy at work...

I would especially like to hear from people who are using the GRAPES
modem and/or using NOS to bridge land-based networks of unix or
novell boxes.

Thanks and 73,

Ben KB2ERP

Jack,

It sounds to me like you want to turn your TNC-2 into a Paccomm Tiny-2
Mark II!

PacComm sells upgrade kits for clock-doubling their Tiny-2... It may well
work in other TNC-2 clones. The EPROM doubling, though, isn't available
as a mod... But it is incorporated in their Mark II. (They also have a
universal DCD mod board.)

No, I'm not affiliated with PacComm, other than owning way too many of
their TNCs!

Here's their info:

PacComm Packet Radio Systems, Inc.
4413 N. Hesperides St.
Tampa, FL 33614-7618
 Voice: 813-874-2980
   FAX: 813-872-8696
CompuServe: 76576,2003 (76576.2003@compuserve.com)

> me (not that you said that - I've just heard it before). One of the
> potential strengths of packet is as a distributed, redundant system.
> Adding a repeater greatly reduces collisions, but at a significant
> expense:

I don't understand why you think these are problems:

- the repeater is a single point-of-failure, and
  many people will not be able to or know
  how to operate without it when the repeater
  dies

Making a better system will encourage stupidity?

- repeater coverage rarely stays localized. After
a while, a better antenna, more power, etc.
and you wind up with a wide-coverage packet
repeater that is jammed up.

Making a useful system will make people want to use it?

I don't see either of your points as being problems. In fact if it were to become a problem then it just points out the need for *more* digital repeaters.

Getting back to the original topic we can discuss the problems of getting coordination since the repeater coordinators consider it packet and not eligible for the same protection as their repeaters.

jv

The UCSD.EDU ftp server has all the latest TCP/IP code. KA9Q JUST
posted his latest version yesterday. s930104.zip is in the
/hamradio/packet/tcpip/ka9q directory. The other flavors of NOS are in
their own directories in the /hamradio/packet/tcpip directory.

That's true, but it's also true that most packet groups are sparse
enough that high site nodes are required *anyway* to maintain connectivity,
and they also serve as a single point failure *and* as a magnet for congestion.
Therefore these arguments apply equally to them. The fact is that a repeater
just works much better than a high site simplex node for packet.

If you stick with just home stations and multi-hop links, then you're
generating even more congestion since each packet is transmitted multiple
times. Home sites are unfortunately not engineered to be non-interfering
cells. And one home station shutting down can fragment the network if it
is the only link between two subnets. That's very common in rough terrain
with sparse networks. The channel delay of multiple hop transmissions also
turns a slow service into an infuriatingly slower service.

Repeaters for packet should best be thought of as large, controlled
coverage cells. Linked by a high speed backbone, they offer high
thruput while minimizing the interference common to simplex networks.

Gary

My understanding is Phil Karn has done it. He released the code in June,
although the initial release had a "peter waiting on paul waiting on peter"
syndrome.   I don't rember the fix. Phil also just released a new
set of code today (yesterday?) on ucsd. Since there were several problems
with the June release (Phil called it beta code; it was somewhere between
alpha and beta quality), none of the other enhancers picked up the code,
opting to stick with the known 12/21/91 release.

This is the code in the 12/21/91 release and derivatives (PA0GRI,
WG7J, etc).

>2 - Demand dial a line, ie when I try to send a packet through that

>

Phil has done the above. According to his last post, the latest
code is split into up, down, and ring scripts so he can share
his modem line with his autoswitch fax!

>Another question: What is the difference between the current KA9Q
>release of NOS and the version maintained by PA0GRI?
>

PA0GRI added several usablity features and started mailbox enhancements.
WG7J took that code and turned it into something close to a full service
bbs, fixing forwarding, starting finger, etc). WG7J is at least at version
1.07b.

No, you can connect to a local socket.   For it to work without a
domain.txt for the hostname, use the loopback address (127.0.0.1).

SLIP is Serial Line IP. It's a trivial protocol for encapsulating an IP
frame on a serial line to do cheap IP networking. KISS is the same
thing for AX.25. Details in the docs in the hamradio/packet collection
on UCSD.EDU.

The term "wormhole" as applied to amateur packet radio (it was
obviously borrowed from science fiction) refers to a link in an
amateur network that uses non-amateur facilities such as a commercial
satellite link, leased line, the Internet, etc.

A wormhole usually encapsulates the amateur packet protocol within
those of the non-ham network in such a way that the non-ham network's
internal details are hidden from the ham user. The two amateur nodes
on the ends of the wormholes appear to be immediate neighbors, even
though there may be much distance and a very complex (non ham) network
between them. Hence the apt allusion to the sci-fi concept of a wormhole.

The allusion is even more apt when you consider that both types of
wormholes are usually provided by fantastically advanced beings with
vastly superior technologies who have a difficult time understanding
the motives and makeup of the primitive corporeal beings that use
them. :-)

Now I know nothing about wormholes except for what was in a recent
newspaper article that discussed them briefly.

It's a VERY theoretical/hypothetical method of travel through space that
allows very rapid/instantaneous travel via these so-called 'wormholes' to
distant (light years of distance) places. It's said that this method, if it
can be figured out enough to use, would allow some forms of spacetravel to
be almost instananeous.

This theory is beyond my understanding, but they claim it has serious
scientific validity.

Please no flames... I'm no trekky, and have no belief in the above one way
or another, just relaying a tiny bit of what the newspaper article said.

Bottom line? Don't look for a wormhole to be available anywhere soon.

Amen!

|> Getting back to the original topic we can discuss the problems of
|> getting coordination since the repeater coordinators consider it
|> packet and not eligible for the same protection as their repeaters.

True. Coordinators have the attitude "if it buzzes, we don't do it."
However, as a wise person observed, "Packet people don't know s**t about
radios; Radio people don't know s**t about packet." In the general case,
regrettably true. Packet folks aren't experienced enough to deal with
coordination lore. AND they don't consider full-duplex regenerators
(aka packet repeaters) as repeaters, because some of the bits get changed.
They really don't but that's a nit. I maintain that there is a signal
that is being received, and the information is being retransmitted in
real-time. THAT's a repeater, and coordinators should be able to
coordinate those, because it's the case that the frequencies need to be
(Oh Gawd, they'll pounce on this...) "protected" by coordination.
Simplex (standard digipeating) packet systems should NOT be coordinated,
at least in terms of spectrum. Packet groups, if they are stupid enough
to get into it, should coordinate that. There's coordination, then there's
coordination.

In the pure sense, repeater coordinators should not represent ANYBODY.
They are a central, neutral, organ that should be used to COORDINATE

the usage of spectrum, under the "accepted standards". The group that decides the "accepted standards" consists of the folks that represent whatever factions that obtain. Rather like the Geneva Convention, I'd venture.

Vox Populi, Vox Dei - Latin for "How did we get into THIS mess?"

Can anyone tell me where the NOS Ethernet drivers are and what they are called?

I would like to use a DEPCA Ethernet adapter manufactured by Digital Equipment Corporation with JNOS (WG7J). From what I have been able to gleen through a variety of sources there is a separate driver similar to a tsr that has to be loaded prior to starting JNOS. Then all you have to do is define the Ehternet port like any other on your system.

Can anyone tell me where I can find out more about this? Does anyone know of someone that has tried this?

TAPR 1993 Annual Meeting

The Annual Meeting of Tucson Amateur Packet Radio will be held on the weekend of March 6th and 7th, 1993 at the Best Western Inn at the Airport, 7060 S. Tucson Blvd, Tucson, Arizona, adjacent to Tucson International Airport.

In addition to the usual presentations of the latest and greatest developments in packet radio, TAPR will host a workshop on digital signal processing (DSP) for radio amateurs. This workshop, to be conducted by Jon Bloom, KE3Z, ARRL Senior Engineer, is designed to teach the fundamentals of digital signal processing. The target students are radio amateurs who understand the basics of complex (modulated) signals and are familiar with computer programming. The course is intended to bridge the gap between these two subjects, with the result that the student will be able to begin programming DSP applications almost immediately. The student's math background should include algebra and trigonometry.

The topics covered by the presentation include:

- Discrete-time systems
- Sampling theory
- Digital filters
- Signal generation and detection

- Review of available literature

We are expecting to have the traditional "pizza bash" and other informal activities on Friday night, March 5, with the meeting all day Saturday, March 6 and the DSP workshop on Sunday, March 7. Registration for the Saturday meeting is $15.00, including a buffet luncheon. There will also be a $5.00 registration fee for the DSP workshop on Sunday to cover the cost of printed workshop materials. A steak dinner on Saturday night will be available for $13.95. TAPR will have a hospitality suite where you can gather informally, join TAPR or purchase kits and software. The meetings will run from 9:00 a.m. to 5:00 p.m. both days.

A block of rooms has been reserved at the special rate of $53.00 per night, single or double occupancy, including full American breakfast and happy hour reception. For reservations, call the Inn at the Airport at 1-800-772-3847, or in Arizona at 602-746-0271, FAX 602-889-7391 (mention TAPR to get this rate).

If you are planning to attend or have a project you would like to present at the meeting, please call or write the TAPR office and let us know. We also would like to know if you are planning to attend the DSP workshop, so sufficient materials will be available. To have your paper included in the printed proceedings of the meeting, camera-ready copy should be submitted to TAPR no later than February 19, 1993. For further information, contact the TAPR office.

Jim,
I can't help you with the 2400 bps modem part of your problem, but I expect that if your 1274 was running 1.1.4, it only has 16k of RAM. 1.1.5 and later require 32K, so you will have to upgrade. I think the instructions are in the 1274 manual, and the chips and instructions are also available from both MFJ and TAPR. The problem with the 2400 bps modem is entirely unrelated to the firmware, I am sure.

Bob

Actually, other than adding the "answer" script, fixing a few minor
bugs and making some internal changes to allow dialing on media other
than asynch lines, I really haven't done anything to the dialer code
in quite some time. I use it constantly (right now, as a matter of
fact) and it is pretty solid.

>>1 - Keep a line up, ie dial a connection to another site and keep it
>>going, redialing automatically if the link should drop. The version

>
>This is the code in the 12/21/91 release and derivatives (PA0GRI,
>WG7J, etc).

Yes, this is what the original dialer did. I ran it for years when I
lived in New Jersey. Even though I never heard a peep from NJ Bell
about the continuous 1 Erlang load on my second phone line, I always
felt a little guilty about it. However, to get the free local call
into Bellcore I had to dial into a location other than the one where I
worked and hop back over a brain-damaged Micom terminal network. This
was such a slow and painful process (and one I could not easily initiate

in the other direction) that I opted to keep the line nailed up
continuously, with the call always placed from home.

However, now that I live in San Diego and am a local phone call away
from Qualcomm's netblazer, I decided to do the job right and bring
up the link only when it's needed.

>>2 - Demand dial a line, ie when I try to send a packet through that
>>port, if the connection is down it dials. If the connection should

>
>Phil has done the above. According to his last post, the latest
>code is split into up, down, and ring scripts so he can share
>his modem line with his autoswitch fax!

Yup, this is exactly how the code works, even down to the single try
per packet. When you send a packet and the link is down, it is held.
If the dial attempt succeeds, the packet (and any others that have
arrived in the send queue) are sent. If the attempt fails, the packet
that caused it is dropped. If there's another packet waiting in
the queue, another attempt is immediately made. Otherwise it waits
for another packet to arrive before it does anything.

I do it this way to avoid any built-in "retry" timeouts in the dialer
code. I instead rely on TCP retransmission backoffs to time each
successive call attempt. I used to redial repeatedly from a single
packet with my own built-in backoff, but this was much less
satisfactory because once you got into that mode, there was no
external way to control it. With the new way I can manually force
continuous redialing by just starting up a repeating ping session
across the path.

I note that the internal hooks are now there to let you implement
"demand dialing" of AX.25 connections if you so desire, although I
don't see much point since an AX.25 "connection" doesn't really cost
anything but a little RAM at each end to keep open and idle.

>No, you can connect to a local socket.   For it to work without a
>domain.txt for the hostname, use the loopback address (127.0.0.1).

Right. This is a convention I picked up from BSD UNIX. You can always
talk to yourself by using IP address 127.0.0.1, regardless of any
other addresses you may have. There's a built-in "pseudo-interface"
called the "loopback" interface with this address.

Deja vu warning...

I happen to agree with this. Using repeaters to reduce collisions
does involve a significant opportunity cost. Unfortunately, the
alternative techniques to "do it right" are still not yet known in the
amateur service. These include:

1. Spread spectrum, which creates a channel that degrades more
gracefully with multiple simultaneous transmitters than does a
narrowband channel.

2. Strong forward error correction coding. By decreasing the required
signal-to-noise(interference) ratio, this enhances the ability of
spread spectrum to tolerate multiple simultaneous transmitters on a
channel. And by reducing the necessary transmitter power to sustain a
link, it also reduces interference to other receivers.

3. Automatic transmitter power control so you never use more power
than is actually necessary to reach a particular node.

4. Automatic routing algorithms with link metrics based on
power/interference estimates so that paths are chosen on the basis of
their minimum impact on overall system capacity. I.e., you would
choose a path of many closely spaced nodes over a few widely spaced
nodes because the much lower power required at each hop would more
than make up for the increased number of hops.

Is it possible, with just a regular land-line (Viva 24MNP modem) modem
and 2 meters to run NOS? I've heard about the Baycom driver for NOS
but don't know where to get it and if it works _well_.

Happy New Year,

There have been that many requests for PPP in AmigaNOS, that I decided
to have a go at including it in my version. As a result, AmigaNOS v2.9k
has the PPP software from the earlier version. I have not had the chance
to put the file out anywhere except 130.88.202.27

Bye for now.
John

Does anyone know where I can find documentation for Ivo's mailer for
the Macintosh, IM/Mac? I can find up-to-the-minute versions, but
I can't find even an old set of docs.

Or is IM/Mac close enough to BM that I can figure it out from BM's
instructions?

Hi!

I'm relatively new to packet, and I've come up with some questions that I can't seem to find answers to...

I think I have the general idea of what a node is and what it does...I gather that I can connect to it and from there I can connect to other stations. But I can't seem to find any info on the commands. A few are obvious...such as CONNECT, BYE, and INFO. But what about the NODES and ROUTES commands? What exactly are they telling me? And the CQ command? It would seem to me that a CQ command ought to send a CQ packet, but I've heard that's not true.

Is there documentation somewhere for these? It's very frustrating to be able to connect to them and find that there is no 'help' and no available documentation.

Thanks,

Chris Moore

I read the FAQ, but I don't understand the distinction between a TNC, a packet radio modem, and a radio used for packet radio. Is a TNC the same thing as a packet radio modem? (I've used phone line modems since 1981, so I pretty well understand what a modem is, but don't understand what a Terminal Node Controller does.)
What I am mainly trying to figure out is this: What type of setup will

allow high speed operation >= 9600 baud?   What bands are used by high-speed packet radio? How many people (approx.) operate at these speeds? What are the limitations?

Thanks for any help,
     Matt Clarke

               FINAL VOTE ACK AND VOTE TALLY

The vote for creation of rec.readio.info passed, with 215 votes in favour (QSL), and 51 votes against (QRT) for a total of 266 unique ballots, when the voting ceased on Wednesday, December 23, 1992 at 2359 UTC.

This meets or exceeds the requirements that more than 100 yes votes be received than no votes, and that greater than 2/3 of the total votes are in favor of the new newsgroup.

Next is a 7-day cooling off period for any objections to be raised. Barring any meaningful objections, the new newsgroup will be created. As the moderator for news.announce.newgroups is going on vacation, I can not guess as to the creation date of this new group, but I will be taking submissions starting the official creation date to the address rec-radio-info@ve6mgs.ampr.ab.ca, with administrative requests at rec-radio-request@ve6mgs.ampr.ab.ca. I invite the moderator team members to begin cross-posting of their bulletins on that date.

Thanks to all who voted! Democracy, I *love* it! I do hope the people that voted no have no hard feelings, and will definitely try to address some of their comments included in their ballots.

The following votes were received by the close of voting, Wednesday, December 23, 1992 at 2359 UTC (5:59 PM Central Standard Time). The list starts with the 215 QSL or Create rec.radio.info votes, followed by the 51 QRT or Do NOT Create rec.radio.info votes. The votes were tallied courtesy Paul W Schleck pschleck@cwis.unomaha.edu.

QSL (Create rec.radio.info, as proposed), 215 unique votes:

---- Now a brief advertisement ----

Newsgroup:
     rec.radio.info (moderated)

/usr/lib/news/newsgroups entry:
     rec.radio.info   Informational postings related to radio.

Charter:
     To provide high quality, informational postings about radio. This
     group will take cross-postings, or moderated postings from the regular
     discussion streams to alieviate the traffic, over expensive links, in
     these groups by allowing the news transfer mechanism to drop articles
     cross posted to rec.radio.info. Postings in the entire rec.radio.*
     heirarchy that the moderators deam as informational, however, are
     likely candidates for cross posting or re-posting. Also by placing the
     informational postings in this group, make it easier for many to find
     radio related information.

By maintaining a high level of quality in the postings, it is hoped that these postings may end up, at least more conveniently, in various archive sites, or possibly over the Amateur Radio Packet BBS network as well.

By using a self-moderator scheme, the hopes are that many of the postings will maintain timeliness, and good propagation through the computer networks.

Hi again.

Question: How do you set up the routing so that several different people could dial into the same slip port or ports on an NOS box? I know this can be done as corporations etc have banks of SLIP dial-ins that many different subnets dial into. But, can KA9Q NOS do it???

Example:
My net, 149.47.200.0, slips to my friend Fred.
My Freds net is 149.47.13.0
Fred slips to a netblazer which is on 149.47.0.0
The netblazer slips to an internet site which is 149.0.0.0

Works fine because every port knows what's going to be on the other side.

Now add in another person who wants to slip into Freds NOS, 149.47.199.0.

When one of us dials into 149.47.0.0, how does NOS know who is there,

and what packets to send??

Now imagine that NOS has 2 or 3 slip ports on a hunt group, and 10
people on different subnets sharing it.

:(

Another question: Has anyone attempted to put some kind of security
on the slip dial in? I don't think it's good practice to have anyone
with a pc and a modem connect to my network.
I want to be able to access my workstation remotely, and I certainly
cannot do this without security on the dial in, since a non-trusted
user could dial in and become any user on my workstation.

Thanks,

Ben KB2ERP

PS: I recognize that many of my posts have little to do with actual
packet operation. I hope that I am not boring too many people here.
But I am attempting a big setup here and I want to get everything
working just right before taking it on the air. Hope you understand.
Thanks.

well, you get to see it tonight -- Here on the Spaced Coast we don't get it
until Saturday AND it's on what is probably the last Monoaural CBS affiliate
in the US (WCPX TV 6). Of course Mono's too good for Space Rangers (gack!).

At least Babylon 5 will be on a stereo station...(WOFL TV 35)...

PRUG(Packet Radio User's Group) in Japan is developping 64kbps system.

The high speed KISS-TNC, which might work well up to a few Mbps, has been
developped by JE1WAZ and his wife (NOCALL).
The 64kbps modem for 1.2GHz FM transceiver has developped by JS1DCF & JK1FNL.

We are trying to use this system for long distance communication.

The success reports will be here soon. (^_^)

Is it possible to connect to an internet (non 44.x.x.x) node from a
ampr node (44.x.x.x) automatically, as is done with normal ampr?

If not, is there a gateway?

mattc@leland.Stanford.EDU (Matthew William Clarke) writes:

>I read the FAQ, but I don't understand the distinction between a TNC, a packet
>radio modem, and a radio used for packet radio. Is a TNC the same thing as

>a packet radio modem? (I've used phone line modems since 1981, so I pretty
>well understand what a modem is, but don't understand what a Terminal Node
>Controller does.)

What we call a "TNC" (terminal node controller) actually has two pieces inside: a PAD (packet assembler-disassembler) that takes the serial data from your computer or terminal and converts it to packets of data in ax.25 format. The output of the PAD is still at digital levels. The second part is the modem that converts the digital output of the PAD to analog tones to modulate a radio. (I'm referring to the outbound data stream here; received data is converted from analog to digital by the modem, and from ax.25 to serial data by the PAD).

The commercially available TNCs generally come with modems for 1200 baud radio operation, but those internal modems can be bypassed (or sometimes replaced) with modems for other modulation speeds or methods. The PAD will generate packets at various speeds, depending on the clock frequencies it's fed. Most TNC PADs will operate at speeds from 300 to at least 9600 baud, and with some modification will go higher (we operate 19.2kB radio channels with TNCs by doubling the crystal frequency in the TNC and using faster components; we bypass the internal modem).

For 1200 baud operation, just about any radio will work. At higher speeds, things become a bit more complex because a) the radios need to switch from transmit to receive very quickly, and b) the modulation is more complex and can't be routed into/out of the radio through the mic and speaker jacks.

>What I am mainly trying to figure out is this: What type of setup will
>allow high speed operation >= 9600 baud? What bands are used by high-speed
>packet radio? How many people (approx.) operate at these speeds? What
>are the limitations?

9600 baud isn't "plug and play" but it's not too difficult. You need a TNC, a 9600 baud modem (available from several of the TNC manufacturers, or you can build one yourself for ~$50 -- the most common design is the "G3RUH" which is compatible with the "K9NG" or "TAPR" designs), and a radio that you're willing to open up and solder on. It's legal to run 9600 baud on 2m and up (it may be legal on 6m also, I'm not sure) but of course you'll want to operate on the same band as other local 9600 baud users (if any -- >1200 baud operation is still very sparse in many
B
areas); I can't help you with that!

If you're considering <starting> a local high-speed packet network, let me suggest another alternative. Kantronics has a UHF radio designed for packet radio that runs at 19.2kB. We've built a network using these radios and, though it still requires an experimenter's touch, we're very happy with it. The cost is very competitive with slower systems, and offers a better baud/buck ratio. If you're interested in this, let me know and I can send you via email an article I wrote about our experiences.

Hello all,

I'm familiar with the WNOS-4A8 package, but its something different to
the original KA9Q.

All is ok for usage on radio. But I want to set up a slip line via modem
and just this part has been removed from WNOS. I got the latest net.386
from ucsd.edu, I hope it was the correct one.

But I could not find any documentation around there. Could someone
please give me a hint, where I can find the appropriate docu?

73, Hans.

In a recent article Phil Karn stated that 'strong forward error correction'
was of advantage in [spread sprectrum] packet radio. As we speak all
COMMERCIAL packet radio (eg RDLAP, MOBITEX etc) uses some form of extensive
(and I take it that translates as 'strong') FEC.

The problem is that, although the bit speed of these systems is 8K - 9K6, the
perceived throughput is not that much greater than our boring old 1200/2400
baud 'straight' (non FEC) packet.

I should like to hear the justification for FEC spelled out clearly, and also
suggest that if no-one has done it yet, perhaps some research on the ACTUAL
throughput of the various flavours of packet be done.

I am interested in getting involved in high speed packet and I have a number of questions. I would also appreciate any information about experiences with high speed packet. I don't have an amateur license but I plan to get one in the new year.

Can the Kantronics D4-10 data radio support speeds faster than 19200 baud (standard speed) through its built in TTL port and data slicer?

Is direct connection to the D4-10's TTL interface compatible with Kantronics 19200 baud modem card? (data scrambling???)
What is the current street price of the D4 radio?
Is there a quantity discount?

What kind of modem is the Grapes 56k baud radio modem and what are its requirements for use?

Has multiple frequency shift keying been employed on the amateur bands?
****
I know that the Kantronics 9600 baud modem card also supports 19200 baud, with both analog and TTL inputs and outputs. One could use that modem for 19200 receive on its analog inputs with a simple wideband FM receiver chip. You could then employ what ever transmit capability you could muster up (1200/2400/9600) for communication to your local tcp/ip server. The server would have a local 19.2k baud user port and a 9600 baud network port. 1200/2400 baud would have to gateway into the server. My question: is there anybody that has or is planing to write software that allows high speed/lowspeed packet and packet acknowledgments over different speed nets? This would seem to be an important capability which would allow high capacity use of the server computer (interactive telnet and FTP) without bringing the regular packet network
to its knees. With the development of fast digital modulation schemes in excess of 64k baud the amateur service could provide fast,reliable and cheap communications services to individuals without ISDN or dialup slip lines.

Thanks for reading this posting. I am relatively new to this news group, so if I'm asking a question that has been recently dealt with, please use low intensity flames.
I'm in the process of bringing up an F6FBB 5.14D BBS, and am also running the BPQ 4.06 node switch with it. This is on a '286 clone w/ 2 Mb memory. The problem I just observed last night is that messages/bulletins longer than approx 3.2K - 3.5K characters will be fine for the first page or so, then the remaining text in the bulletin is badly mangled.

Has anyone with a similar set-up seen this same problem ??

If anyone has any hints/answers/guesses, please forward them to me at: anderson@sdd.comsat.com.

Thanks,
Gary (N3KCD)

This is a real 1200/2400 bps that is RELIABLE. It is not retry several
dozen times and get a real throughput of 100 bps.

Building it is the easy part, convincing *everyone* else on the frequency
to adopt it is the hard part.

Hello -

I am trying to learn about the G3RUH modem and understand how it ticks. I have recovered the unit sample response (impulse response - not the bit response) of the first set of samples in the transmit audio waveform generator, and they look like this:

46,46,46,45,46,48,52,54,49,36,20,15,34,82,145,200
221,200,147,87,43,25,28,39,49,52,50,47,46,46,46,46

Note that there are four samples per bit, therefore the sampling rate is 38400 Hz.

Here's my first question: if you take that unit response and run an FFT on it, you get a result in which the first lobe is at around 1200 Hz, which doesn't make any sense to me. Is this correct?

Second, the hard one. I assume that the waveshape accounts for the phase response of the radio, and tries to precompensate it out. The fact that the impulse response (above) is not symetrical seems to confirm that some phase shifting is going on in the waveform generator. It isn't too hard to figure out the frequency response of the generator and compare it to the ideal response, and be able to derive the frequency response of the radio that this waveshape is intended for (simple use of the FFT vs. ideal frequency response). My second question is: how can I take the impulse response, figure out the intentional phase delay, and compare it against the ideal delay (none) to figure out the phase delay characteristics of the radio this waveshape was designed for?

I am cross-posting this to comp.dsp, in addition to the packet group (rec.radio.amateur.packet) in case somebody there can help, so feel free to elminate the crosspost as appropriate.

Chris

Hello,
 I noticed some messages earlier about using SLIP interfaces
on SUNs, well I would be interested if anyone could mail me
a brief description of how to do it as I would like to be able
to connect a sun network up to my P.C at home that currently
runs WNOS3 running as a task under OS2v2 (which works very well).

Hi all,
is it possible to send mail from internet through packet radio and
vice versa? If that's not the case, could someone relay messages to
Germany?
Thanks!

In <01GTA0F38AS09N4LMR@splava.cc.plattsburgh.edu>,
LEAVITDG@splava.cc.PLattsburgh.EDU says:

>While Roy states that "either there is no message number or a valid
>message number must be there" I find that the valid message number must
>be there. With KA2BQE Brian's idea of condensed R: lines (and I agree
>with him) and W0RLI implementation of condensed headers the message
>number must exsist as it will enter a 0 (zero) if no message number is
>found. REBBS scanning from top to bottom see this as an error es once
>again stops scanning.

W0RLI generates a "short" header and substitutes a 0 if the message
number is invalid or missing. Obviously the originating message
number is NOT 0 but the new header says it is. I told W0RLI this but
he said that's the way the spec reads. I dunno what spec he was
using.

My code will see the number as invalid and will then assume that the
rest of the message is text. If W0RLI left the number off then
everything would be fine.

I also posted a message to this same forum telling people that this
was happening a few weeks ago but received only one private message in
response.

Roy, AA4RE

For those who care, here is the original header spec with some
comments from me where we have evolved on this:

**** AA4RE Note ****
Since the time of the spec, $: for the BID/MID was added as well
as the need for hierarchical address info. The O: for originator
is still valid but no longer required.
****

R:870114/0819p S:870114/1206p AA4RE-1, Gilroy, CA -- 4983/NK6K
NK6K/KE6BX/3830/Hollister, CA/870114/1019z
/W6IXU//Arroyo Grande CA/Wednesday 14-Jan-87 at 1:48 AM
R:870113/1606 @:NK6K Redondo Beach, CA #: 4104 O:NK6K   F:145.36/.01

Headers - a compromise proposal.
(1/13/87)
Note: These comments are necessarily terse, to make them easier to
forward. This proposal is based on input from VE3GYQ, W3IWI,
NK6K, WB6KAJ, and WB6YMH.

Executive summary.

A standard header format is proposed that permits 1) machine
parsable headers, 2) human readability, 3) extendability
4) standard non-standard information.

Why we need a standard.

There are at least two programs waiting to be written that
require a machine readable header. One is a subroutine for BBSes
that can find the originating BBS and send a service message
back. The other is a FWD.TNC file generator that can determine
paths and connectivity by examining passing headers. There are
more.

There is also a desire on the part of sysops to be able to rapidly
scan a message by eye to look for bad routing, loops, dups, and
delays.   This task could be done programatically, but won't be
for some time to come, and will never be performed by simpler
programs on smaller machines.

Why the current standards are not sufficient.

Aside from the Sent and Received times, the R:S: format as
current specified does not provide an easy way to programatically
determine the following pieces of information: Originating User,

message number. These items have been stated as necessary by a number of BBS sysops.

The /this/that/ standard does not provide enough visual fidelity to permit the eyeball scan to take place. This is the reason most often cited for the lack of converts to this standard. The other shortfall is the lack of ability to add regional information in a standard way. Some areas or networks want additional information such as frequencies and grid, areacode, airport, or other positional identifiers. In a fixed field format where the item is identified by its location, null fields would abound when handling several optional special items, e.g. /call/call/city/state/rtime////freq///stime/.

As of late, there are at least three different versions of the /that/that/ "standard", one with an area code field, one with a separate state field, and one without either. This of course invalidates an otherwise acceptable standard due to its dependence on field order.

Attributes of an acceptable standard.

Based on the stated wishes of developers, the following are the requirements of a well-formed header: Each field can be identified by a program. Some fields are required.

Based on the stated wishes of some Sysops/Users, the requirements are: the header is eyeball-readable, the individual sysop can add information to suit his local needs.

Stated more formally:

1. Meet FCC third party requirements (whatever they are)
2. Be compatible with existing software (able to be emitted)
3. Be machine readable (read: easy to parse)
4. Provide all necessary information
5. Provide flexibility for optional information
6. Provide some degree of user friendliness (read: looks nice)

Note: These comments are necessarily terse, to make them easier to forward. This proposal is based on input from VE3GYQ, W3IWI, NK6K, WB6KAJ, and WB6YMH.

The proposal.

These requirements are not mutually exclusive. Rather than use the fixed field/positional style of the /this/that/ standard to meet the machine readable requirement, a field identifier is proposed for each field. Note that the R:S: standard is already close to this. The only thing lost over the /this/that/ format

is some efficiency, more characters are sent. Losses of efficiency are common when humans are involved.

Proposed header format (for the machine readable camp):

```
<header line>      ::= <header field> [<header field>...]
<header field>     ::= <field identifier> <field contents>
<field identifier> ::= <field type> ':'
<field type>       ::= any printable ASCII character except ':'
<field  contents>  ::= a string of printable ASCII characters except ':'
```

Rules:
1. The ':' character may only be used as the termination character of a field type specifier

2. The minimum items which should be included in ALL headers are:
   a) The callsign of the node relaying the message.
   b) The time the message was received.

Items very (very) strongly recommended for all headers:
   a) the message number of the relaying node.
   b) the callsign of the station originating the message.
   c) the location of the node relaying the message.

Optional information:
   a) Additional location information
      1. Grid squares
      2. Area codes
      3. longitude/latitude
   b) Frequency of operation of node
   c) time message was sent by node
   d) Network name
   e) group name
   f) Major maildrop (nearest major node)

Field Identifiers: (Note new field types may be defined as required)

#: message number
@: Node callsign followed by optional location
A: node ALIAS
F: frequency of operation. If gateway multiple frequencies are separated by "/"
G: Grid square of node
L: Long/Lat of node
M: Major node callsign (nearest major relaying node, the APR proposal)

N: Group, node, or network name
O: callsign of originating station
P: Telephone Area code of node
R: Time message was received
S: Time message was sent

While many of the above fields may be deemed of value by different people the following suggested format is recommended

R:861003/0739z @:W1BBS Packet city, KA #:1234 O:W1ABC

Note if the timezone letter is not included it should be replaced with a space to preserve field alignment for visual fidelity.

This header line provides the minimum information which is deemed necessary by large number of SYSOPs, based on current discussions.

The proposed header format allows much flexibility for the individual sysop's without compromising the ability of software to extract the needed information. Following is an example of different headers which conform to this standard. Visual fidelity and machine readability is maintained.

R:861003/0701z @:KB3UD, East Bangor, Pa, G:FN20jv
R:861003/0641z @:K3RLI Wilkes-Barre, PA F:145.01/145.05
R:861003/0430 @:N2AYY-1 Glens Falls, NY O:W1ABC
R:861002/2040z @:WA1FHB, Marlow NH #:5432
R:861002/1741z @:WB1DSW O:W1ABC S:861002/2039z
R:861002/1523z @:W9ZRX #:8768
R:861001/1240 @:WB6KAJ
R:861001/1836 @:W6AXM-1 M:WB6KAJ O:W1ABC P:714

Final Notes: The above differs from the current R:S: standard in that the S: field is missing from the first part. For visual fidelity to be maintained, all stations must agree to use the first two fields in that order. Those wishing to send the S: field may do so later in the header. Dropping the S: from the required fields is based on the premise that the S: field of a station can be inferred from the R: field of the next station.

The RLI/MBL format for the minimum required format is:

R:$J/$Kz @:$O location #:$M O:$P

The "z" is replaced by a space if the BBS uses local time.

I'm working through the logic to tie a TNC directly into our full-duplex
19.2kB packet repeater.

It's pretty straightforward; DCD from the repeater receiver drives the
TNC to prevent TNC data from mixing with repeated data, and vice versa
to keep received data from grunging the TNC when it talks.

But beyond that, has anyone come up with additional logic to improve
performance? e.g., is it worth using latches to give one data source
priority over the other? Are there race conditions to watch for?

Any insight from those who've done this already would be appreciated...

Hi,

I recently downloaded a copy of PA0GRI NOS version 2.01 which the info command
dates as 920725. I am trying to set it up such that I can have one computer
physically connected to an ethernet network and also connected to a separate

computer using a serial SLIP line.

The idea is to be able to get the second computer, the one not connected to the ethernet, to be able to send/receive mail, and have ftp/telnet services. The ethernet network is part of the larger Internet.

I have tried to set up the computers properly and have read the NOS operating manual, the Getting Started with TCP/IP by Ackermann, and the Beginners Guide... by Gary Ford. I have been able to connect the 2 pc's using the serial SLIP connection, but I have failed trying to communicate with the internet.

I am including my AUTOEXEC.NOS file. Please examine it and let me know anything that I may do to accomplish this goal.

Thanks in advance,

Sean
nazareth@janet.ucla.edu

```
# AUTOEXEC.NET
# This is a sample autoexec file for GRINOS version N1BEE 0.72.
# It doesn't have all the fancy features one might hope for, but
# the basics are there, with some hopefully useful comments.
# Any line beginning with a "#" character is treated as a comment.
# To uncomment a line, delete the # character

# NOS needs to know three things about you:  your hostname,
# your  ham callsign, and your IP address.  By convention, the
# hostname # is your callsign in lower case, followed by ".ampr.org".
# The  callsign is generally used in upper case to distinguish it.
# The IP address comes from a local area coordinator.  Note that
# there are a minimum of three places in this file where you need to
# insert your IP address -- here, in the ifconfig command, and at the
# end of each attach command.
hostname test8.icsl.ucla.edu.
ip address [128.97.90.158]

# This should match your IP address
ifconfig loopback ipaddress [128.97.90.158]

# PC setup
isat on
multitask on

# This makes short forms of the hostname work.
domain suffix icsl.ucla.edu.

# NOS needs to know how to convert hostnames to IP addresses.
# You can do this manually via the "DOMAIN.TXT" file, or you can
# use a nameserver if one is available.  To enable the

FEC has several advantages.

First is power gain.  4 to 7 dB of FEC gain against thermal ("white")
is typical, depending on the specific coding technique and
```

implementation chosen and the amount of excess bandwidth available.
Against *non* thermal noise (particularly impulse noise, such as
radars) and when combined with interleaving, FEC gains can be stunning
-- many tens of dB are not uncommon!

These gains are just as though you had added a power amplifier to the
transmitter, put up bigger antennas, or improved your receiver's noise
figure. But it comes from "brains" rather than "brawn".

The second (and related) advantage of FEC is greater resistance to
interference. Interference is really just artificial noise, and since
FEC allows you to operate with a lower signal-to-noise ratio, you can
tolerate more interference from others who share the frequency. And
because you don't need as much power yourself, you cause less
interference to others. This means you can pack co-channel users
closer together, and this more than makes up for the extra bandwidth
needed by the FEC itself.

This is especially important in spread spectrum, where interference is
the limiting factor in network capacity.

Hi, I know that I've seen this in QST and other places, but
since I just traded away my kenwood 205 and picked up a
24at and 2sat Icom, i could use some help. I tried to
hook up my icom like I did the kenwood but I get no tx audio.
I now remember that somewhere I saw a hook up that included a
transformer? Can some kind soul point me to a place I can find
a schematic to interface my 2sat to my tiny-2 ?
Thanks in advance, I really need to get this up this week.

Does anyone know if the LONNY (G7NHK or G7HNK?) is still alive and on
the air? It is one end of a satellite wormhole from New Jersey to
England. There is an entry for it in a node list on one of the
Connecticut nodes but I can't seem to connect to it. I've tried many
different times.

So I wonder if anyone knows whether there is just a static listing
for the node or whether the node still exists.

Hi,

I am interested in setting up connecting a few computers using a variant of nos. One of them will have a direct ethernet connection, and the other will be connected to the first using a SLIP. I have managed the SLIP connection and found that when I telneted from one to the other, I got 'telnet mail'. What I would like to do is run a program on the remote computer and display on the local one. Actually, the programs run would not be graphic--I just want something similar to the UNIX telnet. Any help on how to do this would be appreciated.

I recently downloaded the latest version of the KA9Q NOS TCP/IP package from UCSD.EDU. This latest version seems to no longer support the TELNET SERVER. It does not allow you to "START TELNET" and TELNET does not show up as an option under the START command. Can someone enlighten me on this change. Is there a new alternative I am overlooking.

I would be very interested in aany information anyone would be willing to post regarding a comparison of features and services offered by the various NOS derivatives.

Hi,

I just purchased and am about to complete one of the TAPR II 9600 baud modems. I plan to drive my MFJ1278 with it. My question(s) is: Has anyone out there in net land already done this? If so, are there any gotcha's you would be willing to warn me about?

I figured that before I blindly go soldering in new connectors and cutting traces, I ought to ask for any words of wisdom from those of you who may be veterans at it. (It's the 1278 I'm worried about).

Thanks in advance,

It's simply not configured into the binary that I loaded to ucsd.edu.
If you have Borland C++ 3.1, you can rebuild the package yourself with
whatever options you like. Just go into config.h and set the MAILBOX option.

The reason I didn't put it in is because it's quite large, the version I
have is out of date, and I don't use it anyway. I would like to take
code from whoever is currently working on the mailbox and integrate it
back in to my next release.

FAX 602-749-5636

Heather who handles the phone and everything else has recently got an
e-mail address, I believe. But call her and chat. She is lots of fun
and very helpful.

     You can also join TAPR and get a good news letter.

This is posted on behalf of N6MON, Terry Taylor.

****

Does anyone know if there exists a utility to convert from W0RLI format messages to FidoNet *.MSG (landline BBS) format and back. Ideally, the conversion would also leave intact thet routing and "seen by" (or equivalent) of both systems. I know that AA4RE can accept a landline connection, but Packet BBS's make poor phone BBS's (and vice-versa), especially for non-technical users.

Terry Taylor, N6MON

Yes there is Jeff.. it's called Jkiss which is a kiss only eprom from the G8BPQ package. If you send me a 27256 eprom (doesn't matter if it has something on it or not) I'll send you a Jkiss eprom. I do lots of 'em for the locals..

If you want it, email me direct and I'll send you my mailing address

It was certainly still around at the weekend, I haven't looked since
then. It's G7HNK (although it used to be G4NQO so it might be worthwhile
checking the node list).

You can rip a suitable transformer out of an old transistor radio or
buy one from Radio Shack.

I've having trouble with Net/Mac. I can't seem to make telnet or ftp
connections. I don't know if I've got a problem with my setup, or if the
remote host just isn't hearing me. If you're using Net/Mac successfully,
and especially if you are using SoftKISS, I'd like to hear from you. If
nothing else, I'd like to try copying your autoexec.net and the format of
your hosts files.

Thanks,
Mike

>please tell me about them.
>73's
>--- Andy VE1COR

The call signs of the bbs of the ham sats are:

	bbscall	bdcstcall (for PG)
UO-22	uosat5-11	uosat5-12
kitsat-23	hl01-11	none yet (bbs not open yet)
AO-16	pacsat-11	pacsat-12
LO-19	lusat-11	lusat-12

UO-14 is no longer a ham sat it was replaced by UO-22
FO-20 does not use PB, use a standard packet program

And a full official announcement, complete with vote breakdown, will be
made available when the n.a.n moderator comes back from vacation. Mark
and I wanted to at least let the net know, so they won't be left in
the dark for almost 2 weeks between the end of the vote and the
newsgroup creation, while Dave Lawrence takes a well-deserved holiday
vacation.

The service in the US is provided on GE Americom's KU band K-2 satellite.
As this satellite only provides coverage of the US, Partial Canada and Mexico
the service is unavailable in Europe.

It would be possiable to put up a feed into Europe however regulatory and
financial issues would have to be resolved.

Pagesat Inc is providing airtime and hardware for this project in the US.

We will send you aliterature and info packet via regular mail.

For others interested in this service or expanding it into Ham radio packet
please send mail to Pagesat@pagesat.com requesting literature package.

Pagesat is planning to exihibit this hardware at the Usenix conferance in
San Diego this January.

     Regards Norman Gillaspie

>half duplex mode of course.

The SLIP router on my home Ethernet is a lowly 10 Mhz 286 with
NS16550A's running NOS, and it has no problem at all handling a Codex
3260 FAST dialup modem with a DTE speed of 115.2 kb/s. This is the
same speed as Laplink, and the fastest speed an unmodified PC serial
port can support. And that's full duplex. Of course, actual throughput
is lower since the modem's line speed is only 24.0 kb/s, but V.42bis
compression can improve throughput substantially. I typically get 7.5
kiloBYTES/sec on FTPs of compressible ASCII text, but only 2.7
kilobytes/sec on compressed or encrypted files. Nevertheless, NOS is
still receiving and sending at burst speeds of 115.2 kb/s.

I need to stress that the 16550s are absolutely crucial here. I
program them to trigger an interrupt when the receive FIFO hits 4
characters, but by the time my creaky 286 has finished responding to
the interrupt, it has typically read 13 characters -- with 3 to spare.
A slightly faster DTE or a slower CPU and the 550's FIFO would
overflow, but this combination does quite nicely. Of course, it does
help that I don't generally use the machine as anything other than a
dedicated IP router. In particular I don't usually use it as a
terminal or FTP server, so I avoid other sources of interrupt latency
that could cause it to drop modem characters.

So it *is* possible to use an asynch port on NOS to run at high

speeds. But having said all that, I still agree that a special HDLC
card is the preferable way to drive a high speed radio modem. I just
wish there were better chips than 8530s...

Hi!
I'm a student at Uppsala University trying to set up a local network
between our computer facilities & student apartments. I've seen some good
reviews about the GRAPES 56Kbps modem here in r.r.a.p, but I'd like to
get in touch with the designers or sombody who know the answer to the
following questions:

* What freqency range does GRAPES support (28 - 30 MHz?)
* How much bandwidth does it require?
* Do the designers recommend any particular transverter to the
  145MHz or 432MHz bands?
* How much does the GRAPES cost (as a kit or fully assembled?).
  I'd like to order at least 2 and am curious about the shipping cost
  (airmail to Sweden, Europe), and delivery time.
* Any comments on the Gracillis board? Price/Performance?

Replies by e-mail are most welcome, but not a necessity since I read this
on a weekly basis.

Thank you for your time reading this, and have a Happy New Year!

Hello !

I want to come in contact with (X)YLs & OMs having some experience and
interest in relation with the new Federal Standards for HF radio, especially
in stressed environment (e.g. FS-1045 to 1049).

Do you known these standards ?
Do you have tried to use some ones in experimental communication ?
Are you interested to use them ?

Any information is welcome.

Many thanks in advance

I'd note that our switches have as many as 5 ports to be serviced. A
mix of low and high speeds. Even with 16550s, the interrupt loading is
severe. With the dedicated cards, a 12 MHz 286 will handle the load.
They are a major win for anyone contemplating a network switch.

 [deleted information about Dave's superb data collection]

I thought that others might be interested in using this data on-line (via packet). My DOSGATE system (remember Dave, this is a DOSGATE system, not a "BBS") is accessable from a fairly wide area (I know that there are regular users of the system from New York to Maine and sometimes even Canada). So I am providing access information to the net....

First, to connect to my DOSGATE system:

Connect into your local packet network node. Eventually you need to get into the 'NEDA' network of nodes. Once into the 'NEDA' (North East Data Assoc.) nodes, connect to node WNDHM1.

Once connected to WNDHM1, issue the command to connect to NM1D-2 (note that the '-2' is IMPORTANT!!): C NM1D-2

You should then be connected to my DOSGATE system and receive a prompt similar to "DOSGATE-C:>". At this prompt type REPEATER XXXX, where XXXX is the frequency, town or callsign of the repeater that you are looking for. This is actually a simple 'grep', so you can search for just about anything. Just remember that the data file only contains New England data. This should be handy for anyone travelling through the area.

If you need additional help, type HELP at the DOSGATE prompt. There are several other services available on this DOSGATE system, such as:

```
AutoCall - Online usa callsign database
SeeSats  - Real time satelite tracking information
AutoExam - Online VE type amateur exams from Novice to Extra
CIBBS    - Common interest BBS
MAIL     - Simple email system (non-autoforwarding)
GAMES    - Several adventure style games that can be played on line
```

Remember that this system is usable from anywhere in the packet network. You do NOT need any special type of terminal, computer, or software to make use of this system.

If you can't gain access into my DOSGATE system from your area, why not place a DOSGATE system on the air to serve your area? The software is available at no-charge for amatuer on-the-air uses, contact me for information.

Many thanks to Dave for supplying the most up-to-date repeater data that I have ever come across.

Rich

Lines: 17

I just got a nice, wonderful AEA PK-88 TNC for xmas. Now I can use any

number of standard terminal programs for my Amiga, yes my Amiga 500, but I was wondering if there is any good packet radio specific software for the Amiga computer?

If there is, how might I get a copy? Would anyone be willing to send me a copy of such a program if I sent them a disk and return mailer with postage? I have no modem connected to my amiga, thought I might be able to borrow one if I try real hard. Anything available on Compu-$erve? Any clues would be appreciated.

Please! I'm brand new to packet, so easy on me about this!

Hello again.

My tcp/ip saga continues. I am waiting for modem info to arrive in the mail. Meanwhile, I have gotten the dos KA9Q via anonymous ftp.

This is truly a cool chunk of code. I am planning on having lots of fun writing new modules for it.

THe problem is, I con't find any documentation for it. The only docs I can find are dated 3 or more years ago. Without this info, I am unable to set up the software. Can anyone give me a clue on this?

Second, I need to find out what my interface limitations are. I have an NE1000 ethernet card in the machine, as well as two (8250) serial ports. There IS a driver linked into the NOS called 'Eagle', and the ne1000 IS an eagle card - one of several very different types though... What is involved in getting/linking new drivers, and do I

even NEED any new driver?

I want to set up one port to be a SLIP or PPP dial in port, and one
to be a SLIP dial out port. Eventually I want to add more SLIP dial
in ports, and a port for my TNC.

What are the limitations on the number of serial ports KA9Q NOS can
support?? Does it support shared interrupts, or if not, does it
support non-standard interrupts (ie com4 on irq 5)??

I would like to eventually support 2 packet modems, one dial out SLIP
modem, and 4-6 dial in SLIP modems.

Meanwhile I would be more than happy if I could figure out how to
get the ethernet card working, so that I can telnet into my unix box
and experiment with the software.

If someone could point me toward the docs, or even send me copies of
their configuration files, I would be greatly appreciative! I could
also use some tips re: ethernet drivers.

Thanks!

I have an opportunity to purchase three rock-bound 220mhz tube-type
tranceivers, and I would like to use them using a G3RUH modem.

Does anyone have any experience with Clegg FM-21 tranceivers, either
with standard 202 (1200bps) or RUH (9600bps) packet modems?

Paul

I just got a new Ramsey kit catalog, and note they have
a packet modem kit for about $60 ($72 with case) for the
IBM PC/clones. I wonder if anyone here has buitl that?
I can't tell from the picture what's in it, but there
appear to be 2 ics, a crystal, something on a large
heatsink, plus misc components.

What's the speed (1200, I presume?).

In addition, they have a Microwave Motion Detector for about
$20 ($33 with case). Anyone built that? Would that be
suitable for use as described in the "Trolling for Tailights"
thread on sci.electronics?

THANKS

The user interface hasn't changed *that* much in 3 years. You should be able to get it going from the existing docs, although some of the newer features (such as the autodial slip code) aren't covered.

>Second, I need to find out what my interface limitations are. I have

>even NEED any new driver?

The "eagle" driver referred to in the code is an obsolete 8530 HDLC card that was briefly available on the surplus market some years ago. It has nothing to do with the NE1000.

To support the NE1000 (or any ethernet card) you want to get Russ Nelson's packet driver collection. You run the appropriate driver as a TSR, and then do an "attach packet" command in NOS.

>I want to set up one port to be a SLIP or PPP dial in port, and one
>to be a SLIP dial out port. Eventually I want to add more SLIP dial
>in ports, and a port for my TNC.

You can do this with SLIP. I understand the PPP code is broken (I haven't used it myself so I don't know). One of these days I'll work on it.

>What are the limitations on the number of serial ports KA9Q NOS can
>support?? Does it support shared interrupts, or if not, does it
>support non-standard interrupts (ie com4 on irq 5)??

NOS can in theory support as many serial ports as you can fit on the machine. It does support shared interrupts, although you have to specify this by appending the suffix 'c' (chain) to the IRQ number in the attach line. This tells the driver's interrupt vector to jump to the vector previously installed on that IRQ number when the handler is done. When you attach a series of devices on the same interrupt vector, the last one attached is the first one called when the interrupt occurs.

NOS has always supported nonstandard interrupts since you have to specify both the I/O address and the IRQ number explicitly on the attach line.

>I would like to eventually support 2 packet modems, one dial out SLIP
>modem, and 4-6 dial in SLIP modems.

Be sure to get NS16550A ports.

Phil

Brad --

Most of the 66MHz machines seem to have a toggle where you can move
them between 33MHz and 66MHz clock speeds. I've had some reports of
difficulties in using the higher clock speeds, whereas the lower works
fine. Have you tried that?

Most likely, try 145.01, .03, .05, .07 and .09 as those are pretty
much standard across the country....

Pick up the latest (maybe it was last month?) issue of BoardWatch Magazine.
It has a good rundown of Packet Switched Radio, and also lists several people
you can contact to get software for various computers. Yes, The Amiga was
listed, as well as the ST, and several others.

Frequently Asked Questions for Amateur Packet Radio

Version 1.9 - Last modified 12/27/92

This document is for unlimited distribution.

Please send corrections and additions to:
   packet-faq@uts.amdahl.com
Which will expand to a list of people who are familiar with most packet issues. I hope. ;-)

The Packet Radio FAQ's will be posted on a monthly basis to rec.radio.amateur.packet. The current version of this document is available via anonymous FTP at ftp.cs.buffalo.edu.

Table of contents:

1 Basic Packet Radio Information
   1.1 What is packet radio?
   1.2 What is amateur radio?
   1.3 What can I do on packet radio?
   1.4 Why packet over other digital modes?
   1.5 What elements make up a packet station?
          TNC (Terminal Node Controller)
          Computer or Terminal
          A radio

1.6 What do you mean we can all use the same channel?
1.7 What is AX.25 ?
1.8 Definitions: Commonly used terms in Amateur Packet Radio
1.9 Do's and Don'ts : Rules and Regulations

2 Computing Network Resources for Amateur Packet radio
2.1 What Newsgroups/mailing lists are available?
2.2 What anonymous FTP sites are available
2.3 Are there any gateways for mail or news
Internet / Packet Radio BBS Gateway
LAN Gateways (Packet wormholes via Internet)

3 Networking and special packet protocols
3.1 Are there any other protocols in use other than AX.25?
3.2 What is TCP/IP?
3.3 Networking Schemes
What are some of those other networking schemes?
Digipeaters
KA-Nodes
NET/ROM
ROSE
3.4 BBS message transfer

1 Basic Packet Radio Information

1.1 What is packet radio?

Packet radio is digital communications via amateur radio. Packet radio takes any digital data stream and sends that via radio to another amateur radio station. Packet radio is so named because it sends the data in small burst, or packets.

1.2 What is amateur radio?

Amateur Radio (sometimes called Ham Radio) is individuals using specified radio frequencies for personal enjoyment, experimentation, and the continuation of the radio art. Amateur radio operators must be licensed by their government. In the United States, the Federal Communications Commission issues amateur radio licenses. Normally, a test on operating practices, radio theory, and in some cases morse code proficiency test is administered. Amateur radio is not to be used for commercial purposes. Also, amateur radio operators are restricted from using profanity and using amateur radio for illegal purposes.

For more information on Amateur Radio in general, see the monthly frequently asked questions posting in rec.radio.amateur.misc. A copy of that FAQ is also available from ftp.cs.buffalo.edu.

1.3 What can I do on packet radio?

Keyboard-to-Keyboard contacts:

Like other digital communications modes, packet radio can be used to talk to other amateurs. For those who cannot use HF frequencies, two amateurs can talk to each other from long distances using the packet radio network.

Packet BBS operations:

Many cities have one or more packet Bulletin Board System (BBS) available on the local packet network. Amateurs can check into the BBSes and read messages from other packet users on almost any topic. BBSes are networked together over the packet network to allow messages to reach a broader audience than your local BBS users. Private messages may also be sent to other packet operators, either locally or who use other BBSes. BBSes have the latest ARRL, AMSAT, and propagation bulletins. Many BBSes have a file section containing various text files full of information on amateur radio in general.

DX Packet Cluster:

A recent development is use of packet radio for DX spotting. HF operators connect to the local DX Packet Cluster for the latest reports on DX. Often a user will 'spot' some hot DX and distribute the DX report real time.

File Transfer:

With special software, amateurs can pass any binary files to other amateurs. Currently, this is done with TCP/IP communications, YAPP, and other specialized protocols.

Satellite Communications:

Many of the amateur radio satellites contain microcomputer systems that can provide special information to amateurs. Some satellites contain CCD cameras on board and you can download images of the earth and the stars. Others provide store and forward packet mailboxes to allow rapid message transfers over long distances. Some satellites use AX.25, some use special packet protocols developed for satellite communications. A few transmit AX.25 packets over FM transmitters, but most use SSB transmissions.

1.4 Why packet over other digital modes?

Packet has three great advantages over other digital modes: transparency, error correction, and automatic control.

The operation of a packet station is transparent to the end user; connect to the other station, type in your message, and it is sent automatically. The Terminal Node Controller (TNC) automatically divides the message into packets, keys the transmitter and sends the

packets. While receiving packets, the TNC automatically decodes, checks for errors, and displays the received messages. In addition, any packet TNC can be used a packet relay station, sometimes called a digipeater. This allows for greater range by stringing several packet stations together.

Packet radio provides error free communications because of built in error detection schemes. If a packet is received, it is checked for errors and will be displayed only if it is correct.

With VHF/UHF packet, many countries allow packet operators to operate in automatic control mode. This means that you can leave your packet station on constantly. Other users can connect to you at any time they wish to see if you are home. Some TNC's even have Personal BBSes (sometimes called mailboxes) so other amateurs can leave you messages if you are not at home.

Another advantage of packet over other modes is the ability for many users to be able to simultaneously use the same frequency channel simultaneously.

1.5 What elements make up a packet station?

TNC (Terminal Node Controller) A TNC contains a modem to decode the audio signals into digital signals. It also contains a modem and a microcomputer to convert the digital signals into text that can be sent over a RS-232 port to the computer. The CPU also handles the protocol overhead of the packet station. When you send data, it takes the text, puts error checking on it (CRC) and also puts it in an envelope for sending. When receiving a signal, it takes it out of the envelope, and sends the message to the computer.

Most TNC's use 1200 baud for local UHF/VHF packet and 300 baud for long distance HF packet communications. For VHF/UHF packet, higher speeds modems are available, but often are harder to interface.

Computer or Terminal This is the user interface. A computer running a terminal program or just a dumb terminal can be used. For computers, any phone modem communications program can be adapted for packet use or customized packet radio programs are available.

A radio For 1200 baud UHF/VHF packet, commonly available narrow band FM voice radios are used. For HF packet, 300 baud data is used over single side band modulation. For high speed packet (anything greater than 1200 baud), special radios or modified FM radios must be used.

1.6 What do you mean we can all use the same channel?

Packet radio uses a protocol called AX.25. AX.25 specifies channel access (ability to transmit on the channel) to be handled by CSMA (Carrier Sense Multiple Access) If you need to transmit, your TNC

monitors the channel to see if someone else is transmitting. If no one else is transmitting, then the radio keys up and the TNC sends it's packet. All the other stations hear the packet and do not transmit until you are done. Unfortunately, 2 stations could accidentally transmit at the same time. This is called a collision. If a collision occurs, neither TNC will receive a reply back from the last packet it sent. Each TNC will wait a random amount of time and then retransmit the packet.

In actuality, a more complex scheme is used to determine when the TNC transmits. See the "AX.25 Protocol Specification" for more information.

1.7 What is AX.25?

AX.25 (Amateur X.25) is the communications protocol used for packet radio. A protocol is a standard for how two computer systems are to communicate with each other, somewhat analogous to using business format when writing a business letter. AX.25 was developed in the 1970's and based of the wired network protocol X.25. Because of the difference in the transport medium (radios vs wires) and because of different addressing schemes, X.25 was modified to suit amateur radio's needs. AX.25 includes a digipeater field to allow other stations to automatically repeat packets to extend the range of transmitters. One advantage of AX.25 is that every packet sent contains the senders and recipients amateur radio callsign, thus providing station identification with every transmission.

1.8 Definitions: Commonly used terms in Amateur Packet Radio

44 net - The class A network designator for TCP/IP amateur packet radio. All numerical TCP/IP addresses are in the format 44.xxx.xxx.xxx.

AFSK - Audio Frequency Shift Keying. A method of representing digital information by using different audio frequencies modulated on a carrier.

AMPR - Amateur Packet Radio.

ampr.org - The high level domain recognized on Internet for amateur packet radio TCP/IP.

AX.25 - Amateur X.25 protocol. The basis of most packet systems. See section 1.7 for more information.

CRC - Cyclical Redundancy Code. The error detection scheme included in each packet. Verify that the packet was received error free.

CSMA - Carrier Sense Multiple Access. A system allowing many stations to use the same radio frequency simultaneously for packet

communications.

digi - Short name for a digipeater

digipeater - A packet radio station used for repeating packets. See section 3.3.1 for more information.

FCC - Federal Communications Commission. Regulates and issues licenses for amateur radio in the United States.

FM - Frequency Modulation. The radio modulation scheme used for VHF and UHF packet communications.

FSK - Frequency Shift Keying. A method of representing digital information by shifting the radio carrier different amounts to represent ones and zeros.

HDLC - (High-Level Data Link Control Procedures) A standard for high level link control. (ISO 3309)

KA9Q NOS - (KA9Q Network Operating System) A TCP/IP program originally developed by Phil Karn, KA9Q. Currently there are many different versions available. See section 3.2 for more information.

KA-Node - A simple networking scheme developed by TNC maker Kantronics. See section 3.3.2 for more info.

KISS - Keep It Simple Stupid. A simple interface developed for communications between TNCs and computers. This allows for most of the packet processing to be handled by the computer. Commonly used with packet TCP/IP software.

LAN - Local Area Network. A packet network developed for communications throughout a city or region. Often, the LAN uses separate frequencies from inter-city packet links.

modem - Modulator/Demodulator. Converts the analog signals into binary data stream (a series of ones and zeros) for the TNC or a micro-computer . First step in decoding packets.

NET/ROM - A scheme for packet radio networking. See section 3.3.3 for more information.

NODE - A network node. Often a network node running NET/ROM.

protocol - A standard used for intercommunications between different computer systems.

RS-232 (RS-323C) - A (more or less) standard for interconnection of serial peripherals to small computer systems. In packet radio, RS-232 is the most common interface between TNC's and the Computer/Terminal.

SSB - Single Side Band Modulation. The radio modulation scheme use for HF packet and satellite packet communications.

TAPR - Tucson Amateur packet Radio. Was the first group to create a packet radio TNC using AX.25. Soon a TAPR TNC became cloned by many others. TAPR continues development of packet radio equipment.

TCP/IP - Transmission Control Protocol/Internet Protocol. A set of utility programs used over AX.25. See sections 3.2 for more information.

TNC - Terminal Node Controller. See section 1.5 for more information.

1.9 Do's and Don'ts : Rules and Regulations

NOTE: These regulations apply only to amateurs regulated by the FCC (United States), but often are similar to regulations in other countries.

[Since I have no experience with amateur radio in other countries, I cannot make any comments. Please bring any notable exceptions to my attention. -Steve S.]

Although there are no specific rules that apply to amateur packet radio, the general amateur radio rules force some restrictions on packet usage.

> Can I set up a TNC at home and one at work so I can check my Electronic mail via packet?

This cannot be done without special restrictions. Amateur radio rules prohibit any business. Since you could have mail from your boss (or maybe even someone selling you something over Internet), that would constitute business activity and is specifically prohibited.

Profanity can also be a complication. Since you have no control over the language used in E-mail, proper filtering is required. Since no filter scheme can catch every offense, it is best to say every message must be hand filtered.

> I would like to set up a packet radio gateway between a land line computer network and the packet network. Is this possible?

Yes, and there are several such gateways in use, but they must be managed with caution. Electronic mail may be pass FROM the packet network INTO the land line network without intervention. However, mail passed TO packet radio is considered third party traffic (the sender is not an amateur) and these messages must be hand filtered to

assure that rules of message content are followed.

> It's my license if I send use packet radio illegally anyway, so what does anyone else care!?

Packet radio is one of the few NETWORKED systems in amateur radio. Many people have helped develop the network and there are many amateurs who own parts of the packet radio network. Sending packet BBS mail, digipeating, and sharing the channel involves the licenses of MANY people. Because of FCC rules stating that anything to come out of a transmitter (either in automatic mode or via your direct control) is the licensees responsibility, one illegal message sent over the packet radio network could literally jeopardize the license of thousands of other amateurs. When in doubt, it is best to check with other amateurs about sending the message before it is sent.

> I have some ideas on how to use packet radio in a new way, but I don't know if it is legal. Who could tell me if I can do it legally?

The worst thing you can do is talk to the FCC about such an issue. The FCC rules are written to be general enough to encompass but not restrict new radio activities. In the past, any non-thought-out requests sent to the FCC have meant a reduction of privilege for all amateur radio operators.

The best source for legal assistance is your national amateur radio association. In the United States, that is the American Radio Relay League (ARRL). Another good place for such conversations is over Usenet/packet mailing lists, or the amateur radio BBS network.

2 Computing Network Resources for Amateur Packet radio

This section summarizes the resources available on Internet for amateur packet radio operators.

2.1 What Newsgroups/mailing lists are available?

This is a list of all groups that regularly discuss amateur packet radio. For newsgroups, join the group through use of your news reader. For mailing lists, add a '-request' to the end of the list name to request subscriptions. For listserv groups, send mail to 'listserv' at the node which contains the list. The first line of the mail should be 'SUBSCRIBE groupname yourname'. Send the command 'help' for more information.

rec.radio.amateur.packet (Newsgroup): General discussions involving Packet Radio.

rec.radio.amateur.misc (Newsgroup): General amateur radio discussion. Usually does not contain any particular information about Amateur Packet Radio.

rec.radio.amateur.policy (Newsgroup): Discussion of regulation policies regarding every aspect of amateur radio. Occasionally deals with polices of packet coordination and legal issues of packet radio.

rec.radio.swap (Newsgroup): General For-Sale for any radio equipment. Occasionally will have packet equipment for sale. Recommended location for any amateur packet radio for-sale items.

info-hams@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.misc Usenet discussion.

packet-radio@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.packet Usenet discussion.

ham-policy@ucsd.edu (Listserv group): A digest redistribution of the rec.radio.amateur.policy Usenet discussion

hs-modem@wb3ffv.ampr.org (Mailing list): Discussion of high speed modems and radios available and future plans. Also includes discussion of networking using high speed modems.

tcp-group@ucsd.edu (Mailing list): Group discussion technical developments of TCP/IP over packet radio and use of the NOS TCP/IP programs.

gateways@uhm.ampr.org (Mailing list): Discussion of current gateways and future plans for gateways. May deal with sensitive internetworking issues.

For all lists at ucsd.edu, archives may be found via anonymous FTP at ucsd.edu. Some listserv groups also have archives. Send the command 'help' to the group's listserv for more information. Digest mailings for the ucsd.edu discussions are also available. Send mail to listserv@ucsd.edu with the first line being 'longindex' for more information.

2.2 What anonymous FTP sites are available for getting packet radio information and programs?

This is a sampling of FTP sites that carry amateur packet radio related files. Consult the Archie archive server for info on locating particular files. For more information on using archie, send mail to archie@cs.mcgill.edu with the line 'help'.

ucsd.edu

Primary distribution site of KA9Q's derived TCP/IP packages. Also,

general packet radio information.

wsmr-simtel20.army.mil

Very large collection of amateur radio software.

wuarchive.wustl.edu

Mirror site of Simtel20 archives. Unix directory structure, which is
easier to use then the simtel20 archive.

ftp.cs.buffalo.edu

Supplimental archive site for amateur radio information. Contains
current copies of all rec.radio.amatuer.* FAQ's.

tomcat.gsfc.nasa.gov

Packet software including Baycomm, Rose, G8BPQ, NOS, etc.

akutaktak.andrew.cmu.edu

SoftKiss for the Mac, in /aw0g. Requires NET/Mac.
SoftKiss is an init/cdev/driver that allows a MAC to do packet using
a Poor Man's Packet modem.

sumex-aim.stanford.edu

NET/Mac, a package to do TCP/IP (as well as AX.25) with SoftKiss or a TNC in
KISS mode. Windows are not scrollable or savable, but individual sessions
can be recorded into a file.

[Sounds _very_ much like "just a Mac port ;-)" of KA9Q to me - SEW]

2.3 How do I contact the ARRL via electronic mail?

There are various addresses at ARRL HQ, but the most important one is
probably info@arrl.org. That is where general information about the
ARRL can be acquired. This address reaches a person, so you'll have
to specify what/who you're looking for.

2.4 Are there any gateways for mail or news between Internet and Amateur Packet radio?

Internet / Packet Radio BBS Gateway

Jim Durham, W2XO, maintains a gateway between Internet and the Packet
radio BBS system.

To mail from Internet to Packet:

1. Mail to: "bbs@w2xo.pgh.pa.us"

2. Make the first line of the text a Packet BBS "send" command, ie:
SP TOCALL @ BBSCALL.ROUTING-HINTS < FROMCALL

3. The "subject" line of the Internet mail becomes the "title" line
of the Packet BBS mail.

NOTE: Because of FCC regulations, Jim must hand filter each message sent FROM Internet TO the Amateur Packet Radio BBS system. Messages should be of minimal length and appropriate content. Read Section 1.9 (Do's and Don'ts: Rules and Regulations) regarding appropriate usage of packet radio for more information. Always include the routing hints with the BBS callsign.

To mail from Packet to Internet:

1. The amateur radio operator must have his callsign registered in the gateway alias list. If you want to mail from packet to a specific amateur on Internet, send mail to 'durham@w2xo.pgh.ps.us' (Internet) or 'W2XO @ W2XO.#WPA.PA.USA.NAOM' (Packet BBS mail) with his/her amateur callsign and their Internet address.

2. Once the above is accomplished, packet BBS mail should be sent to 'CALL @ W2XO.#WPA.PA.USA.NAOM'. The mail will automatically be forwarded to the Internet address of the amateur with the 'CALL' callsign.

Jim Durham's Internet address is 'durham@w2xo.pgh.ps.us'.

LAN Gateways (Packet wormholes via Internet)

Currently a group of amateurs are experimenting with connecting packet LANs together via Internet IP inside IP Encapsulation. Some of the gateways only accept TCP/IP packets, others AX.25 packets. These gateways uses the Internet as a transport medium, thus it is impossible to access the packet radio network from Internet. For more information, join the Gateways mailing list by sending mail to "gateways-request@uhm.ampr.org".

3 Networking and special packet protocols

This is a sample of some of the more popular networking schemes available today. By far, there are more customized networking schemes used than listed. Consult your local packet network guru for specific network information.

3.1 Are there any other protocols in use other than AX.25?

AX.25 is considered the defacto standard protocol for amateur radio use and is even recognized by many countries as a legal operation mode. However, there are other standards. TCP/IP is used in some areas for amateur radio. Also, some networking protocols use other packet formats than AX.25.

Often, special packet radio protocols are encapsulated within AX.25 packet frames. This is done to insure compliance with regulations requiring packet radio transmissions to be in the form of AX.25. However, details of AX.25 encapsulation rules vary from country to country.

3.2 What is TCP/IP?

TCP/IP stands for Transmission Control Protocol/Internet Protocol. This is commonly used over the Internet wired computer network. The TCP/IP suite contains different transmission facilities such as FTP (File Transfer Protocol), SMTP (Simple Mail Transport Protocol), Telnet (Remote terminal protocol), and NNTP (Net News Transfer Protocol)

The KA9Q NOS program (also called NET) is the most commonly used version of TCP/IP in packet radio. NOS originally was written for the PC compatible. However, NOS has been ported to many different computers such as the Amiga, Macintosh, Unix, and others. Smaller computers like the Commodore 64 and the Timex-Sinclar do not currently have version of NOS available.

3.3 Networking Schemes

What are some of those other networking schemes?

During the early days of amateur packet radio, it became apparent that a packet network was needed. To this end, the following packet network schemes where created.

Digipeaters

The first networking scheme with packet radio was Digipeaters. Digipeaters would simply look at a packet, and if it's call was in the digipeater field, it would resend the packet. Digipeaters allow the extension of range of a transmitter by retransmitting any packets addressed to the digipeater.

This scheme worked well with only a few people on the radio channel. However, as packet became more popular, digipeaters soon were clogging up the airwaves with traffic being repeated over long distances. Also, if a packet got lost by one of the digipeaters, the originator station would have to retransmit the packet again, forcing every digipeater to transmit again and causing more congestion.

KA-Nodes

Kantronics improved on the digipeater slightly and created KA-Nodes. As with digipeaters, KA-Nodes simply repeat AX.25 frames. However, a KA-Node acknowledges every transmission each link instead of over the entire route. Therefore, instead of an end-to-end acknowledgement, KA-Nodes allow for more reliable connections because acknowledgments only carried on one link. KA-Nodes therefore are more reliable than digipeaters, but are not a true network. It is similar like having to wire your own telephone network to make a phone call.

NET/ROM

NET/ROM was one of the first networking schemes to try to address the problems with digipeaters. A user connects to a NET/ROM station as if connecting to any other packet station. From there, he can issue commands to instruct the station to connect to another user locally or connect to another NET/ROM station. This connect then connect again means that to a user's TNC, you are connected to a local station only and it's transmissions does not have to be digipeated over the entire network and risk loosing packets. This local connection proved to be more reliable.

NET/ROM doesn't use all of the AX.25 protocol. Instead, it uses special AX.25 packets called Unnumbered Information (UI) packets and then put their own special protocol on top of AX.25. This is again used to increase efficiency of it's transmissions.

NET/ROM is a commercial firmware (software put on a chip) program that is used as a replacement ROM in TAPR type TNC's. Other programs are available to emulate NET/ROM. Among them are TheNet, G8BPQ node switch, MSYS, and some versions of NET.

NET/ROM nodes, at regular intervals, transmit to other nodes their current list of known nodes. This is good because as new nodes come on-line, they are automatically integrated in the network, but if band conditions such as ducting occur, unreachable nodes can be entered into node lists. This causes the NET/ROM routing software to choose routes to distant nodes that are impossible. This problem requires users to develop a route to a distant node manually defining each hop instead of using the automatic routing feature.

ROSE

Rose is another networking protocol derived from X.25. Rose nodes have a static list of the nodes it can reach. For a user to use a ROSE switch, he issues a connect with the destination station and in the digipeater field places the call of the local rose switch and the distant rose switch the destination station can hear. Other then that,

the network is completely transparent to the user.

The static routing tables ROSE uses ensures that packet routing does not use unreliable links such as NET/ROM suffers from. However, ROSE suffers from it's inability to change it's routing table as new nodes come on line. The operator must manually change every routing table, thus ROSE networks require greater maintenance times.

3.4 BBS message transfer

Many of the BBS programs used in packet radio allow for mail and bulletins to be transferred over the packet radio network. The BBSes use a special forwarding protocol developed originally by Hank Oredsen, W0RLI.

Besides full service BBSes, many TNC makers have developed Personal BBS software to allow full service BBS to forward mail directly to the amateurs TNC. This allows operators to receive packet mail at night and avoid tying up the network during busy hours.

It shouldn't be hard in this day and age to find a motherboard that's

5 times as fast as my lowly 10 Mhz 286. :-)

Seriously, I do agree that the dedicated HDLC card is the way to go.
In fact, what I would really like to see is an HDLC chip that's as
smart as a modern Ethernet controller, with the ability to run
autonomously for as many packets as you have memory to give it for
buffering.

This is NOT to say that the board should do any higher level protocol
processing, only that it should make the interrupt latency
requirements on the host processor as loose as possible. One of the
biggest drawbacks of the "internal thread" model of multitasking that
I use in NOS is that the whole package comes to a standstill whenever
a task makes a slow BIOS call (like floppy I/O). It's nice to have
hardware interfaces that can ride through these "seizures" without
dropping packets.

Of course, one alternative is to make an entire machine the controller
and never use it for anything but driving the interfaces and routing
IP datagrams. That's what I do at home, and it works very well.

Phil

I lost my working and backup copy of TheNet 1.1 to a disk crash some time
back, and discovered my backups were bad also. Can someone tell me where
I might anon ftp it, or even mail it to me? Archie lists a "thenet" but
upon inspection, all I saw was text files :-(I have X1G, but this
particular project needs 1.1. Also lost the "setnet" utility..

thanks..

sam

Where do I find a schematic diagram for a PC-interface card,
based on the 8530 chip ?
It should also be possible to use it with the ka9q software.
I'm planning to use my old -286 for packet radio only and hook
it up to my ethernet at home.

thanx in advance

Subject: DOSGATE: the simple overview
Message-ID: <1785@necis.UUCP>
Date: 30 Dec 92 17:41:07 GMT
Organization: still seeking it

Lines: 131

Hi, It seems that I havn't sent this information out for some time now.
I was reminded about this by getting a slurry of information requests
about DOSGATE after mentioning it in a previous post. So I am posting
this information for others to see. I hope this answers many of the
questions that I have been receiving... If you are not interested in
this, you are free to ignore it.

Here is a quick summary of DOSGATE.

 I wrote DOSGATE several years ago. The first prototype was actually written
about the same time that Hank, W0RLI wrote his now famous packet BBS software.
DOSGATE has gone through several revisions and refinements since that first
version. The current version (as of 12/30/92) is 1.17.

 DOSGATE requires any PC compatible computer. This can be a simple 8088, 4MHz
IBM-PC (remember these?), or a 66MHz 486 system. DOSGATE can use either
the COM1 or the COM2 serial port. The interface cable between the TNC and
the computer must be a full modem handshake cable. This means that pins
2 through 8 and pin 20 of the 25 pin DB-25 must be wired (you can NOT use
a simple three wire RS-232 cable). I believe that this version of DOSGATE
is fairly TNC independant. This means that is should work with just about
any TNC. I use Kantronix TNCs, so I have the most experience with these and
know that they work fine with DOSGATE.

 The packet user of DOSGATE does NOT require any special hardware or software!
If the user is on packet, then they can use DOSGATE. This means that even
users who have a dumb terminal, Macintosh or any other hardware can make use
of the DOSGATE system and its programs. Sometimes people have a hard time
understanding that they don't need to be using an MS-DOS computer or some
special software to remotely use the DOSGATE system. Anyone who can connect
to an AX.25 packet TNC can remotely use the DOSGATE system and its software.

 The DOSGATE driver itself is not very large. It is only about 20K or so
in size, so it doesn't consume a lot of memory or disk space. In fact, you do
not even need a hard disk to provide a DOSGATE system. There have been several
floppy diskette based DOSGATE systems on the air.

To allow you to get a useful system up and running quickly, I include a
diskfull of utilities and programs on the DOSGATE distribution diskette.
I completly fill a 1.2 MB diskette! Here is a list of some of the utilities
that I include:

    MAIL - several programs that implement a *simple* email system. This
           is NOT a full functioning auto-forwarding email system! It will
           accept incoming email from an auto-forwarding bbs (such as W0RLI
           PBBS's) but will NOT forward outgoing email.

    AUTOCALL - This utility allows the use of the Buckmaster HAMCALL CD-ROM

to provide on-line searches of the USA database. At this time only callsign searches are allowed.

SEESATS - Real time OSCAR satelite tracking. This is a text based tracking program that allows users to determine when satelites and other objects (such as the Space Shuttle) are in view.

AutoExam - This program generated a different exam, from Novice to Extra, each time it is run. This allows one to practice for VE exam session.

Advent - The clasical computer game of Adventure. You must be carefull or you will find yourself lost for hours in twisty little mazes that look all alike!

I also include hints about how to install your system to provide a bit of security. Although some security can be installed, it is a very simple system that is easily bypassed. For this reason, I strongly recommend that your on-the-air DOSGATE system be a separate computer that is DEDICATED to this purpose! You do not want to have any 'private' files or data on your DOSGATE system. You should also maintain backup copies of any important files!

DOSGATE is implemented as a standard MS-DOS device driver. This device driver is loaded via the CONFIG.SYS 'DEVICE=' command. When loaded, DOSGATE handles all screen and keyboard I/O. It basically echos all output that is sent to the screen to the COM port. Also, any data that is recieved by the COM port is entered into the systems' keyboard buffer. This means that the local DOSGATE 'sysop' can see all that a remote user is doing. It also allows the sysop to help the remote user. If the sysop types on the DOSGATE keyboard while a user is connected, then the user will see what the sysop types.

Limitations: Any standard MS-DOS program is compatible with DOSGATE as long as it is only TEXT based (no graphics, and no color). If the program only uses MS-DOS for its output, then there is no problem with this. If the program uses BIOS calls, or directly accesses the PC hardware for I/O, then it will not function under DOSGATE. Unfortunately, many programs do not use MS-DOS for output, so you must perform some simple tests to be sure any program will work correctly before allowing general users to access it. Also, any program being used under DOSGATE must return immediatly to the MS-DOS prompt when a CONTROL-C is pressed. Any program being used must not make use of the same COM port as is being used by the DOSGATE driver.

These are fairly simple restrictions, but are important. It is very easy to write applications for DOSGATE using 'C'. Some people even use compiled BASIC to generate DOSGATE applications. The only other limitation to what you can do with DOSGATE is your imagination! If you know how to write programs for the PC, then you can make your DOSGATE system do whatever you want.

Note: I do not include a comprehensive, step-by-step instruction manual with the DOSGATE system. There are many example files and other hints and kinks to help you get started. It is expected that you are already

very familliar with both MS-DOS and your TNC. If you do not think that you have enough experience with MS-DOS or your TNC, then please find youself a local MS-DOS 'guru' and someone who understands packet radio and the particular brand of TNC that you own.

 To get your own copy of DOSGATE simply send me the following:

   1 FORMATTED, 1.2 MB or 1.44 MB diskette
   1 Self Addressed, return diskette mailer that contains enough postage
     to ensure that I can return your diskette to you.
   1 short note requesting a copy of DOSGATE

 Send your disk to:

  Rich Bono
  7 Redfield Circle
  Derry, New Hampshire 03038

  There is no required fee for Amateur radio on-the-air uses of DOSGATE, but any donations are always gladly accepted.

   Where do I find a schematic diagram for a PC-interface card,
   based on the 8530 chip ?
   It should also be possible to use it with the ka9q software.

I'm planning to use my old -286 for packet radio only and hook
it up to my ethernet at home.

I have a design for just such a card that I can share in postscript or
Orcad formats. It was based on using a JDR protoboard and I have new
PALs for it, JEDEC or PALASM files available too.

>
>My questions: (1) What would be best: a SLIP line between the two machines,
>or an Ethernet adaptor (3-Com) on the NOS machine?
>

I vote for Ethernet. SLIP lines are more troublesome. Unix boxes have
a habit of crashing when using SLIP. We found this to be the case with
Sun workstations. Your milage may vary. It may depend on precisely
what MUX board you use.

>(2) Should tof the two ends of the SLIP line be a part of the
>Class B office net or should they be in the 44.nn.nn.nn ampr.org net?
>

TCP/IP requires seperate NETWORKS for the SLIP and Ethernet. This may
be accomplished by subnetting. Subnetting amounts to carving up your
Class Bnto multiple networks.

>(3) Does KA9Q NOS allow different IP addresses for the SLIP port and the
>AX25 port on the NOS machine?
>
>Any help or comments would be appreciated, especially from those of you
>that have put a ham TCP/IP machine on a local Ethernet.

I have successfully put an IBM PC clone on the Internet using KA9Q.
We were using subnetting already on our net (139.121.x.y). I have not
had the opportunity to try SLIP or AX.25 with KA9Q yet.

A local store has this kit in stock. It looks like it is a Baycom
modem. If this is the case, it would use the TCM3105 chip. It comes
with the Baycom software. The package says it is for VHF radios.

The '90-'91 ARRL Repeater Guide (a pocket-sized book) skipped the So Calif.
listing of 2 Meter packet frequencies for some reason (intentional?
Northern Calif. and all other states were listed).

Anyone know if the '92-'93 version has the missing So California packet
frequency information?

The Repeater Directory only lists information provided by area frequency coordinators. Perhaps the 2-meter coordinator for SOCAL either didn't supply information, or asked that it not be publsihed.

>Anyone know if the '92-'93 version has the missing So California packet

Sometime around or after the middle of March (when my license arrives
???), I'd like to get into packet. I currently own an Alinco DJ-580T.
I know that packet can be done on this radio, but it practical? If
yes, what are your suggestions (and cost estimates, if you have them)?
If not, why not.

Thanks for your input.

Buddy Brannan, a blind amateur radio operator, was riding an Austin, Texas, city bus about 1 PM on Wednesday, Dec. 30, talking on his handy-talkie. A guy on the bus asked him about the radio and Buddy gave him a demo. The guy liked it so much he asked to look at the radio and ripped it off. Jumped off the bus and left Buddy on the bus.

Here is a description of the thief, as given by the bus driver: Black man, 28 to 35 years old, dark complexion, medium height (5'6" or 5'7"), medium build, short haircut (no afro or anything like that). It happened at the end of the #10 South 1st route (approx. William Cannon and S. 1st).

The radio is a Yaesu FT-470 dual-bander, serial number 450452, with its stock battery pack (probably dead by now). No leather carry case. For identification purposes, memory channel 19 is programmed for 410.00 and channel 20 for 470.00 MHz.

If you should encounter this radio, please contact Buddy at (512) 452-6172, or via Internet at davros@ccwf.cc.utexas.edu. Thank you.

>card is the preferable way to drive a high speed radio modem. I just
>wish there were better chips than 8530s...

Better chips then the 8530 are available. Only for the most there aren't
boards and drivers available. A 8530 pin comparable solution is available.
It is the Zilog Z85230 ESCC and has more buffering. The Rx buffer is increased
from 3 to 8 and the Tx buffer is increased from 1 to 4. After reset the ESCC
is compatible with the SCC. The improvements of the ESCC must be enabled with
new instructions. The SCC driver of PE1CHL NET has support for the ESCC and
works with a mixed configuration of SCC and ESCC.

I have done a lot of testing of early and current version. We use the ESCC
in Holland more then one year without problems. Test results are:
64Kbaud full duplex with an OptoPcScc card (no dma) with upgraded optocouplers
in a 25MHz 386 ISA computer and PE1CHL NET.

The price of the 10MHz Z85230 ESCC is about the double of the cmos SCC.
Only the Z85230 is difficult to get. I have some stock at home.

And if it's as accurate as the information in the 91-92 edition,
you'll have more toilet paper when the Sear's catalog runs out.

Hello,

I just purchased a Kantronics kpc3 tnc and am having trouble getting it
fired up. I issue a connect request, and the XMIT light illuminates
periodically, then eventually times out. The xmit light on my yaesu handheld
never lights; the book suggests that the tnc/HT cable might be bad.

Here's the sticky part: this cable came unassembled, and I had to connect a
DB-9 connector, 0.1uF cap and 2.2K res on one end, and the 2 mini-plugs for
the HT on the other end. I've retraced my connections, and I just can't find
a mistake, but I'm always quickest to blame my own handiwork. :)

Could the wiring picture be slightly wrong, e.g. the picture's bigger plug is
actually the little plug, etc. ??   Any suggestions are welcomed.

How to Use the WB7TPY
Packet <-> Internet Gateway

First, some brief operational notes:

(1) Messages must not contain any foul language, or commercial purpose.
(2) Messages can only be sent to countries that the United States has
    a third-party agreement. All others will be destroyed.
(3) Messages from the internet should be less then 5K in length.
    No files should be sent.
(4) If you have questions, please do not hesitate to contact me either on
    packet radio: WB7TPY@WB7TPY.AZ.USA.NA   -or-
    Internet   : david@stat.com   -or-
    Fidonet   : David Dodell @ 1:114/15

(5) Have fun. Use the gateway as much as you like. That is what it is
    there for.

From Internet to Packet

Send mail to the internet address of:

gate@wb7tpy.ampr.org

The first line of text must contain a full packet address, proceeded with the word "Packet:"

For example, mail to my packet address, would have the first line of text;

Packet: wb7tpy@wb7tpy.az.usa.na

From Packet to Internet

Send as private mail (never a bulletin) to the packet address of:

gate@wb7tpy.az.usa.na

The first line of text must contain a full domained internet address, proceeded with the word "Internet:"

For example, mail to my internet address, would have the first line of text;

This message is distributed to "ca". If you get it outside of California,
I'm sorry.

I now have a portable packet system consisting of TI '286 laptop,
two-band HT, and BayCom modem.

I'm thinking about installing a packet base system using a '386 desktop
and dedicated radio(s) and TNC(s). I'd like to know what high-speed packet
systems are available to connect to in the S.F. Bay area, and if I will
get much use from a 9600, 19.2K, or 56K packet modem. I've been writing
Unix device drivers for about 10 years, and have administered systems
that are connected to the internet, so I don't expect insurmountable
technical challenges.

Also, I'd like to connect with anyone who has been working on
distributed health-and-welfare databases for emergency work. This is
one area where 1200-baud packet could excel.

Thanks!

Phil it was probably Pactor but also could have been Clover, both have been
seen and heard on the bands.

Kantronics has Pactor for the KAM, a EPROM change. AEA is working on it and I
believe has it but I haven't seen it.

Hi Steve,
   I have packet access available to users here in the HAMlink RBBS too.
The way I am handling it here is that everyone has read-only access to
the PBBS area on the landline BBS, but in order to send a message you
must send a copy of your license to me. I keep that in file in case
there should be any trouble down the road. Then I can show what the
user represented to me to be their license. I never expect to have any
trouble with that, but these days you never can tell.
   At the moment, I do not see anything wrong with what you are doing.

It sounds like you screen each message, so that it does not hit the
Amateur Packet network without being seen by you the control operator.
As long as there is good security in place, there is no problem.
   BTW, since Novices are using your station they should be able to
enter messages too. How are you taking care of that?

Hello-
     The November issue of 73 magazine had a short, but informative,
piece on spread-spectrum technology, including some speculation on its
appropriateness in micro-cell architecture. I'd like to follow up on
some of the equipment suppliers mentioned , but I can't find them in
the usual directories. Anybody have contact points (phone, email, fax)
for:

Tetherless Access, Ltd.
PacComm (Florida)
GRE America
Senses Data Corporation
O'Neill Communications

In the spirit of pre-cooperation, I include the info on places I was able
to find:

Subject: Standard for TNC/Radio cables

  I don't have direct access to the network, this is being posted
through a packet radio gateway.
  There was reference to COBRA radio interface recently.
  This should be CAIRO .. Communications Audio Interface for
Remote Operations. The original concept for this was to patch

equipment together during emergency operations. All operators
in a group have standard socket on the radio (or an external
box with the socket), into which extension audio cables
can be added, or loudspeakers, headsets, foot switch, etc.
It means you can quickly run a cable from your car/automobile
in to an emergency centre, without the need initially of
installing aerials.
  The basic connections use a 7 pin DIN audio connector.
The microphone is taken as a balanced pair from the socket at the
rig end. A four-core individually screened cable is used.
Connections (6) Secondary AF feed
            (1) Primary AF feed
            (4) Push to talk
            (2) Screens
            (5) Microphone (low)
            (3) Microphone (high)
            (7) Low power DC feed
The isolated microphone connections are designated Mic high and Mic low,
they are NOT alternative impedances.
  There is a small book published with the full specification of the
connection standards.

I'm not sure about the KPC-3 but the other Kantronics TNC's (KPC-2 and
KAM, at least) are not upgradable to 9600. Kantronics does most of the
HDLC functions in software and the processor just isn't fast enough to run
at 9600. I suspect the KPC-3 is the same.

If you want want to upgrade to 9600, look for a used PK-88 or MFJ 1270 for
good, cheap, upgradable units. They can be had for $50-75 at swap meets.
Add a TAPR 9600 modem and you're in business.

Subject: rsgb gb2rs news 6th december
Distribution: world
Organization: 5/10
X-Mailer: Simple NEWS 1.90 (ka9q DIS 1.18)
Lines: 137
Date: Fri, 4 Dec 1992 11:15:38 +0000
Message-ID: <723473382snz@tedb.demon.co.uk>
Sender: usenet@demon.co.uk

Good morning. It's Sunday the 6th of December and here is the GB2RS news
broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- Three new countries have been added to the DXCC list;
the Radiocommunications Agency have released details of two successful
prosecutions and we have the latest news of the South Pole expedition.

The ARRL Awards Committee has announced that Croatia, Slovenia and
Bosnia-Hercegovina have been added to DXCC Countries List. Croatia now 9A but
formerly YU2, and Slovenia now S5 formerly YU3, are added for contacts made
after the 25th of May 1991. Bosnia-Hercegovina now 4N4 formerly YU4 is added
for contacts made after the 14th of October 1991. The DXCC Desk will accept
cards received at ARRL Headquarters after the 1st of January 1993, but any

received before the 1st will be returned without action.

Last week the Radiocommunications Agency released details of two successful prosecutions against people who abuse amateur radio. At Sale Magistrates Court on the 29th of May 1992, two radio amateurs were convicted under Section 1 (1) of the Wireless Telegraphy Act 1949, having pleaded guilty to charges of using radio apparatus other than in accordance with a licence. The defendants were conditionally discharged and ordered to pay costs of 112 each. All equipment was forfeited.

The Pentland South Pole Expedition is progressing well. The position of Sir Ranulph Fiennes and Dr Mike Stroud by Monday the 30th was 81 degrees 15 mins South, 39 degrees 55 mins West. They are now off the Filshner Ice Shelf and on land, but the going is very hard due to sustrugi - wind compressed snow ridges - which can be up to 3 to 4 feet high. They are walking about ten miles per day, and are on schedule. They are now experiencing 24 hour sunlight. On the communications side, Morag, GM0MUV, has been using her VP8/GB4MSS call to talk to amateurs, but contact has been very difficult this week, due to the magnetic field and 24 hour sunlight conditions. However, due to evening sporadic E openings contact is irregular but possible. Her communication with the walkers is, however, excellent and the comms link is working well.

The RSGB Mencap Albania Appeal, which was launched in April 1992, has now closed having raised some 4,500. Competition winners will be notified very soon and full details will appear in January's Radio Communication.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From the Ivory Coast, OH8SR will sign TU4SR from now, until Monday the 21st of December, mainly on the WARC bands, and on CW. From Haiti, HH2PK is often active on 160 metres from 0100 to 0300GMT on 1825kHz, CW or 1842kHz, SSB. From Martinique, FB1MUX will sign FM2GO until Monday the 7th of December. This is the first use of the FM2 prefix. From Ogasawara Island, JA5AUC, JA5IGK and JA5JFB will append /JD1 from Friday the 11th, to Sunday the 13th of December on all bands.

Rally news now and we know of no rally scheduled for this weekend, but there are three events that we know of for next Sunday, the 13th:

The Centre of England Christmas Radio, Computer, Electronics and Communications Rally is to be held at the National Motorcycle Museum, near the National Exhibition Centre, Birmingham. Take junction 6 off the M42 motorway. Doors open at 11.00am or 10.30 for disabled visitors. There will be trade stands and refreshments will be available. There is ample car parking space and talk-in will be on channel S22. Further details can be obtained from Frank, G4UMF, by telephoning 0952 598173.

The Leeds and District Amateur Radio Society Rally is to be held at the Pudsey Civic Centre, Dawsons Corner, Pudsey, Leeds. The Centre is located near the junction of the Leeds Outer Ring road with the Bradford road. Doors open at 10.45am and there will be all the usual facilities. Further details can be obtained from John, G0FWP, by telephoning 0532 589652.

The Verulam Amateur Radio Club's Christmas Rally is to be held at the

University of Hertfordshire. Formerly the Hatfield Polytechnic, located just off the A1(M)/A414 South of the Hatfield tunnel. Doors open at 11.00am. There will be the usual trade stands and a bring and buy stall.

Contest news now:

Today, Sunday the 6th of December, there is the Independent Finland 75 year Anniversary Contest, from 0000 to 2400. All bands 80 to 10 metres will be used, excluding the WARC bands, on CW and SSB. See December's RadCom page 15 for further information. During next weekend there is the ARRL 10 Metre Contest, from 0000 on Saturday the 12th, to 2400 on Sunday the 13th. See December's RadCom page 15 for further information. In December's RadCom on page 62 the rules of the LF Cumulative Contest 1993 differs from the HF Contest Calendar. The rules are correct and a new HF Contest Calendar, supplied by the HF Contest Manager, will appear in January 1993 RadCom.

Next some VHF Contest news:

The RSGB 144MHz AFS Fixed and SWL Contest takes place today, Sunday the 6th, from 0900 to 1700GMT. See July RadCom for further details. During tomorrow Monday the 7th, the fifth and final leg of the RSGB's 1.3 and 2.3GHz Cumulative Contest takes place between 2030 to 2300GMT. See June RadCom for details. The next RSGB 70, 144 and 432MHz Fixed Station Contest is scheduled to run from Saturday the 26th, to Tuesday the 29th of December. See July RadCom for further details

And now the solar factual data:

The period 23rd to 29th November has seen 2 small M flares. The largest was on the 23rd, an M4.4/SF, but little came of it. Sunspot counts meaned about the 140s, and the solar flux levels averaged 161 units, with little variation day to day. The geomagnetic Ap index declined from very unsettled levels of 35 units on the 23rd, down to quiet levels by the 26th, and averaged 11 units for the period. The state has been nil, nothing to report, throughout the period. The radio quality indices have been above normal all the period with the Tokyo circuit being up to excellent at times. The aa indices as supplied by the British Geological Survey for the period 17th to 23rd November was generally quiet, with daily averages of 21 nanoTeslas, about K3. The 23rd was the most disturbed day with 44.8 nanoTeslas, about K4.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, averaged 11.4MHz. With the darkness hour lows being 3.2MHz. There was a little spread F and other phenomena reported some days.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 9.9MHz and the darkness hour lows 3.0MHz. There is still no news about when the Lerwick ionosonde will be operational, or how the repairs to the Slough one is progressing, but we have been assured that the matters are in hand.

And lastly the solar forecast:

This week, the quiet side of the sun will be looking our way, geomagnetic activity is expected to be quiet all the week. Solar flux levels are expected to be about the 130s with MUFs during day light being about 30MHz, and darkness hour lows about 18MHz. Generally HF bands conditions are expected to be good.

And that's the end of the solar information.

Finally in the main news, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S S and G7 N X series, and Novice calls in the 20 A E and 21 B H series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Since several people have asked and I haven't seen a response
from GRAPES themselves, here is the address I have for them:

GRAPES Inc., P.O. Box 871, Alpharetta, GA 30239-0871

I think Doug, KD4NC is President. Kits are $250.

Enjoy,
     harold

Mail to lucky bounces - So hopefully this will reach you:

Hi Lucky -

Have been using PAX since you mailed it to me. GREAT PROGRAM!!
Only one thing that I'd like to see - A way to set an environment
variable so that when I hot-key to PAX from D:\WP51 or whatever
directory that I'm in, the PAXCAP files (save) and/or the send
files could be in another directory. I realize that the 'send'
key allows me to specify disk and directory, but the PAXCAP files
end up in whatever disk/directory I'm in when I hot-key to PAX.
Other than that - Congratulations to Raj on the BEST and SIMPLEST
of the packet programs that I have run across yet.

I have been following the discussions on high speed (9600 bps and up)
tcp/ip networking with great interest.

I would like to get involved with this but I am having a hard time
finding out exactly what it is people are doing, and what equipment
and software they are using to do it.

I am not all that interested in plugging a 1200 baud packet modem in
order to achieve tty style communications.

I get the impression that there are people who are doing much more
than that, ie running tcp/ip routers (ka9q??) between their own wired
lans and the local packet networks, and running smtp, ftp, telnetting
or rlogging into bbs and other services, sharing local news through
running public nntp servers. Perhaps even running distributed
applications or databases???

I also gather that people are modifying their equipment, or using
video equipment, for high speed, but there doesn't seem to be many
hams who are well versed in this.

I would like to jump into this head first, ie gather what software I
need off the net, write what I can't get, modify the equipment I
have, or build/buy what I need etc... Get it on the air and start
playing!

Can someone give me a quick rundown on what others are doing, and the
standards, equipment, and software they are using???

Thanks!

Ben

PS: I already have a lan with a unix box and a spare 386 for running
pc based software, also some older 2M equipment that isn't doing
anything. So what I really need is the glue to put it together.

>assumes that someone else will do it? :-)

No and Yes. :-)

The packet radio FAQ was started 1 1/2 years ago by myself. I wrote
two versions and posted them to the net. As my schedule got busier, I
stopped posting the FAQ. Eventually, a group of users convinced me to
start posting the FAQ again and we started an FAQ list
(packet-faq@uts.amdahl.com) for the FAQ maintainers. I even got a
large collection of new material to put in the next FAQ revision.

Unfortunately, I got busy again and had to ask someone else to take the
FAQ over. Steve Watt KD6GGD (steve@wattres.sj.ca.us) offered to take
over the job of writing the FAQ. Currently, he is writing a new FAQ.

Not wanting to step on Steve's toes, I have not posted my old FAQ.
As suggested by another poster, my old FAQ can be found via
anonymous FTP at ftp.cs.buffalo.edu as /pub/ham-radio/faq_packet.

-Steve Schallehn KB0AGD
 Kansas State University

PS: For those without FTP abilities, the FAQ can be retrieved via mail.
The following is from the rec.radio.amateur.misc FAQ:

    * Access to FTP archives via electronic mail
        ANY BITNET, EARN, or NorthNET site can access the Princeton mail
        server. It will be most efficient if you know the complete path
        and filename for anything you wish to transfer, but you can use

'cd' and 'ls -l' commands to move about and browse the remote site's directories. The Archie database server may also be useful to search for files and their directory locations on FTP sites around the world (see below). Please be patient when using non-interactive mail servers such as BITFTP as each request may take several hours (or longer) to be fulfilled.

For access to the FTP server, send email to bitftp@pucc.bitnet (for BITNET, EARN and NorthNET users ONLY!). Subject doesn't matter. The text of the email is the FTP commands one after another. For example, suppose you wanted to access the FTP site lcs.mit.edu:

```
FTP lcs.mit.edu
USER anonymous
PASS yourname@yoursite      (not required)
ASCII
CD telecom-archives
GET filenames
BYE
```

A help file is available giving detailed instructions by putting the single word HELP into the text of the email.

For nonBITNET users, there is also a FTPMAIL server at ftpmail@decwrl.dec.com (16.1.0.1). Commands include: REPLY <mailaddr>, CONNECT [HOST [user [pass]]], ASCII, BINARY, COMPRESS, COMPACT, UUENCODE, BTOA, LS <directory>, DIR <directory>, GET <file>, QUIT, HELP. Get the help file for more information by sending mail with the single line "help". The ftpmail site may complain if you try try to get more than 1 file per email request. Here is an example of a request:

```
reply your_name@your_site
connect uxc.cso.uiuc.edu
binary
uuencode
get pub/ham-radio/Tech.v3.3.sit.hqx.Z
quit
```

A note on the use of FTP mailservers: If you want to use FTP mailservers, like FTPMAIL, please be considerate of any systems that your mail must pass through. The quickest way to find yourself cut off from the world is to make the admins of sites that pass your mail pass 60Mb of X11 graphics system source. If you need large amounts of information from a mailserver, contact your admin for help -- it may already be available, or he may know a better way to get it.

Summary: FTP to tomcat.gsfc.nasa.gov and get /public/de406bpq.exe

G8BPQ networking software for the Kantronics DataEngine (Version 4.06)
is available on tomcat.gsfc.nasa.gov under the name:

  /public/de406bpq.exe

Until Tom has the opportunity to clean up the archive, ignore the
presence of /public/g8bpq/de406bpq.exe as it is a mistake; I forgot to
use BINARY mode when transferring the first time.

I have also placed de406bpq.exe in the incoming directory of ucsd.edu.
Hopefully it will be moved the the hamradio/packet/g8bpq directory
soon.

Subject: 10 December meeting, Northern NJ
Summary: December meeting of RATS on 12/10
Message-ID: <1992Dec5.151414.49@panix.com>
Date: Sat, 5 Dec 1992 15:14:14 GMT
Organization: Panix, NYC
Keywords: Meet NNJ RATS ROSE
Lines: 31

The next meeting of the Radio Amateur Telecommunications Society (RATS)
is this coming Thursday night. The program includes a demonstration of
the latest packet application for the Mac by Mark Sproul, KB2ICI. This
is a packet channel activity monitoring program which has to be seen to

be believed!

RATS meets on the second Thursday of each month at the Wendy's restaraunt
(yes, really, Wendy's!) on Route 46 West in Little Falls, NJ. This is
a little west of where Routes 3 and 46 merge. People begin to arrive at
about 6:45 PM, and the meeting program begins at 7:45 PM. Informal talk-in
is on the 145.19 MHz (-600) K2AQG repeater in Montclair, NJ.

Questions can be directed to:

Telephone: 201-387-8897	Nancy and Gordon Beattie, N2FWI and N2DSY
Telephone: 718-956-0027	Andrew Funk, KB7UV
Packet: kb7uv@kb7uv.#nli.ny.usa	Andrew Funk, KB7UV
Packet: askrat@kb4cyc.nj.usa	RATS board of directors
Internet: kb7uv@panix.com	Andrew Funk, KB7UV
BBS: 718-956-7133	wait for the Login prompt!

73,

Andrew Funk, KB7UV
Vice Chair, RATS

> (statements about waiting 5 minutes on the phone with ICOM deleted)

Originally I had written out quite a large, detailed flame about ICOM, and how
they have the poorest service of ANY company I have had to call before.

I won't go into that, but it has been since January or February that I called, and
I am still steamed about it. Let's just say I was too harsh, so I restarted my
article.

They make great equipment, but I will probably avoid ever purchasing anything from
them again because of the experiences I had. What a shame...

5 minutes??? you are lucky! I spent around 45 minutes, and probably 85% of it on
hold. Had to call about 5 or 6 times, talk to a ton of people who didn't know
what to do, then found one who did, only she didn't do what she said she would, so
I called back a week later and told somebody else that I was being treated rudely
and inconsiderately (on hold for 15 minutes??? yes, I tried calling back a number
of times, but the "please hold, your call will be answered in the order it was
received" kept me on, o

nly to find out they were out to lunch!!)... blah blah blah...

I do LOVE my radio, but I pray I don't have to ever call them or deal with them
AGAIN!

Hi

I am interested to know if there are any packet-satellite to internet
gateways out there. I know of a few that serve as gateways form
internet to regular land packet-radio. But can one use those to put
messages on satellites, for sending email half way across the world.

Any help will be greatly appreciated.

>should be looking for in a TNC?

The Kantronics BBS (913.842.4678) has an KPC-3 information file called
KPC-3.INF. I copied it below for everyone's enjoyment. Current list
price is $119.95 US. Street prices are below $110.00 US. I have no
affiliation with Kantronics, but know several people who work there.

-Steve Schallehn KB0AGD
 Kansas State University

---------------(KPC-3.INF Follows)--------

KPC-3

The KPC-3 is a small-sized, low power Packet Communicator providing VHF packet capability. The KPC-3 ships standard with 32K battery-backed RAM, and can be expanded to a maximum of 512K bytes. The KPC-3 also includes WEFAX reception (Weather Facsimile), Kiss Mode for TCP/IP, a personal packet bulletin board system (PBBS), and the ability to be a KA-NODE. Kantronics Host mode is fully implemented so you can use your Host Master II+ software or other host software written for our Host mode.

The KPC-3 features a new two-level command set. The NEWUSER command set has only 23 commands - normally all you'll need to get started in packet radio. As you progress, you can enable the full TERMINAL command set of over 130 commands. The KPC-3 also comes with a Getting Started manual and a complete Reference Manual.

In addition, the KPC-3 has room inside the case to install a standard 9-volt transistor radio battery to operate the unit portable. The KPC-3 requires less than 40 milliamps current and can be powered by 6-25 volts DC through an external jack.

The audio in, audio out, push-to-talk, and ground of your radio are connected to the KPC-3 through a standard Kantronics DB-9 connector on the rear panel. Connection to the computer is through a DB-25 connector on the rear panel.

In order to display WEFAX pictures your computer needs to be running a program that understands how to receive the picture information and display it on the screen or printer.

The personal packet bulletin board system (PBBS) provides you the capability of storing messages in your KPC-3 for your friends, and letting them send messages to you, even when your computer is turned off. Your PBBS can accept messages automatically forwarded to you by full-service BBS systems, and can even reverse forward messages from your PBBS into the full-service system.

The KA-NODE allows the KPC-3 to be better than just a digipeater. Instead of just repeating what it hears the KA-NODE will handle acknowledgments between it and the end user, or another node. This results in better thruput so the frequency can be more fully utilized.

(c) Copyright 1989, Kantronics Co., Inc., All Rights Reserved

Features

- VHF packet

- WEFAX (Weather Facsimile reception)

- PBBS (Personal Packet Bulletin Board)

- KA-NODE

- Kiss Mode for TCP/IP

- Kantronics Host Mode

- Full duplex capability

- Size: 0.8" x 5.2" x 5.2", Weight: 11 oz

- Requires 6-25 VDC at < 40 ma

- Includes DB-9 connector and backshell, 3 ft of 5 conductor shielded cable,
  2.1 mm power jack

- Technical help is only a phone call away

Options

- Real-time clock

- 128K static RAM chip

- Host Mode programs for PC compatibles, Commodore 64/128, and Macintosh

- WEFAX programs for the PC compatibles, Commodore 64/128, and Macintosh

- Terminal programs for the PC compatibles and Commodore 64/128

Looks like we now have an automatic header censor on the network. I
am receiving messages where it is obvious that the headers have been
rewritten to match one author's idea of what they should look like.

Unfortunately, the coding job is imperfect and AA4RE based BBS systems will choke on the improper output of the "censor" as well as being handicapped by the lack of information coded on headers generated by the "BB" code.

The result is going to be misaddressed messages and duplicate bulletins.

I expect some flame back from somebody saying my code isn't up to spec. However, 1) my copy of the spec says mine is ok and, more importantly, 2) the AA4RE version has been out there for 9 months and this "censor" is very recent, I don't go along with that reasoning.

Roy, AA4RE

I am looking for a landline PBBS on Long Island. I do not have my license yet,
but I ma just waiting for the oppurtunity to take it. My only set back is that
I know even if I got my license tomorrow, I wouldn't be bale to afford a
radio for quite some time. (I am a starving college student you know)

Thanks a lot for the information, I'd love ot get a taste of PBBS!!

I have just learned of the passing of James Eaton. Jim was the father of
Pete Eaton, WB9FLW, one of the early pioneers of amateur packet radio.
Pete's father, Jim, was not a ham, but was vitally interested in TAPR and the
development of packet radio. He was an active behind-the-scenes supporter of
TAPR. Jim built display equipment for, and helped to work the TAPR booth at
Dayton for many years.

Hams who have been involved with packet since the 1980's will be well aware of the selfless contributions that Pete Eaton, WB9FLW, has made to the hobby.

Memorial services for Mr. James Eaton will be held Wednesday, 9 December, in Duquoin, IL. Condolence notes may be sent to Pete, and his mother, at 35 Norspur, Route 4, Edwardsville, IL, 62025.

posted on behalf of Andy Freeborn, N0CCZ, past president of TAPR

yes. Some manufacturers may have slight variations in a few commands, but they are basically the same.

>   -I started reading the docs on the KPC-3. Does anybody know what the
>transfer rate (in BPS) is?

I imagine it is a 1200 baud modem. But you can always psych yourself out and set ABAUD to 9600 (the speed which the TNC and computer talk at), regardless of the modem speed! ;)

>   -There was mention of WEFAX capability, as well as TCP/IP.
>   Does anybody know if the required software exists for the

Sorry, I don't know about the amiga, although I do remember a thread a while back
about AmigaNOS.

Anybody know where I might lay my hands on catalogs for Ham radios
used for packet and/or TNCs?

Much appreciated..

I seem to be having difficulty getting transmit audio to work.
Does anyone have experience with this particular radio/TNC combination?
My cables are wired correctly as per the manual. The TNC's analog loopback
test works fine. PTT activates correctly, but I can't seem to get any audio
in the transmitted signal. Someone has suggested that I need a resistor
somewhere in the PTT/transmit-audio part of the cable. Is this true?
This packet beginner will greatly appreciate any advice...

Well, actually, the question is a little more involved. I am looking for
some information.

First, what is the cheapest route to go for a TNC for normal packet use?

Second, what about for TCP/IP use? I have heard that some cheap TNC's
won't do TCP/IP since they are software driven and not hardware?

Third, for a dedicated station, is Alinco's "Data radio" any good and
will it to packet and tcp/ip? Are there other people who make combined
TNC and radios?

Lastly, what does it take, equipment and radiowise, to do at least 9600bps
rather than 1200? I am told most people are running 1200bps and that the
next step from 1200 is 9600. What will it take if one upgrades?

This information is to be presented to my group. I'd appreciate your
input as to the BEST way to go based on price, upgradibility, etc. We
are trying to look at as many angles as possible.

Thankyou.

For those BBS users who are also Amateur Radio Operators, there is available
HAM Related files and information at the HAM Connection Server. Other files
are available for sysops of various software products. The info is as follows:

System: The HAM Connection
Sysop: N5UYH Grady
Data: 409-833-1795
Hours of operation: 24 hours/ 7 days per week Downloads on first call.
Baud Rates: 1200-38400 Baud
Hayes Optima Smartmodem 9.6KB V.32BIS/ V.42BIS
Modem was changed due to a system crash and was down for 2 weeks for repair.

This post was also cross-posted to rec.radio.amateur.misc and
rec.radio.amateur.packet for all interested parties. This service is free
and I would appreciate any flames directed to dev/null as they will not be
answered unless considered constructive criticism. All opinions are my own.

Jonathan, I think you need to give more information on:
1) What computer are you using now? 2) Are you willing
to build the tnc, and radio?

If you are using a commodore 64 or commodore 128, you can
use Digicom software ($40), and if you are building your
own radio you can buy the kit from Ramsey Electronics\
own radio you can buy the kit from Ramsey Electronics
for $150-175 depending on whether you want their kit.

If you are using IBM compatible computers Baycom and
A&A Engineering on the west coast offer a board for
packet $60-90 depending on whether you want them to build
it or not.

If, you don't want to build the radio I would consider
Radio Shack's 2m radio (Suggested List price $260, I've
called my local R.S. and they haven't dropped the price
from last year!)

This is all new equipment. Used equipment, could cost who
knows?

Just an addition: The Kantronics upgrade is $59.95 for KAM 5.0 users.

They pay a royalty for the software. I should have asked, but didnt't,
what the price would be for <5.0 KAMs.

$79.95 for users below 5.0. Save $10.00 from the cost of separate
Version 5.00 ($30.00) and Version 6.00 ($59.95) upgrades. :-)

I need to setup a communications channel running between 2 nos's each running
in different desqview windows. This is on a 80386DX at 33MHZ with 8MB ram.
I don't want each nos talking out a com port with a null modem between!
I do want each nos talking to the packet driver 'nodedrv4' and that talking
to bpq!

How do I setup the bpqcfg.txt file?
What are the parameters for nodedrv4?
What are the parameters in the nos startup file for the 'attach packet' line?

PS There will be no physical radio links in this setup!!!

Hi OMs,

ich habe gerade auf einer CD-ROM (NetNews) das Packet-Radio-Programm PktWin
fuer MS-Windows 3.0 gefunden. Es stammt von G4YFE und ist eine Alfa-Release.

Gepostet wurde es in die Gruppe rec.radio.amateur.packet.

Hat jemand Erfahrungen damit (Stabilitat usw.).

Vy 73 de Sven.

I'll answer these two together. I recommend the MFJ1270B or the PacComm Tiny 2 as the TNCs of choice. Both are a little over $100, with the MFJ being slightly cheaper at $119. Both are derivatives of the TAPR TNC2 so firmware revisions and hardware add ons work without problems. The later versions of the firmware support KISS, but I prefer to use the KISS only K3MC program burned into my own ROM. This prevents the TNC from inadvertently dropping out of KISS mode due to a power bump. Since they both have the TAPR modem disconnect header, they accept 9600 baud modems, satellite PSK modems, and can be modified to drive a 56 kb GRAPES modem. The Kantronics TNCs, while good products, use a different processor so they can't take advantage of common firmware upgrades like The Net and can't use the widely available aftermarket

modems without considerable modification due to the lack of a disconnect header. The software and modem systems work at the lower speeds, but tie up the resources of your desktop machine doing bit banging tasks best offloaded on a dedicated processor. Disk interrupts and the like can corrupt packets by disrupting the timing.

>Third, for a dedicated station, is Alinco's "Data radio" any good and
>will it to packet and tcp/ip? Are there other people who make combined

The Alinco radio is simply their 2 meter voice radio sans microphone. It works fine for 1200 baud packet, but then so do most 2 meter voice radios.

>rather than 1200? I am told most people are running 1200bps and that the
>next step from 1200 is 9600. What will it take if one upgrades?

9600 is the next logical step up from 1200 baud. Kantronics has 2400 baud modems, but the improvement in thruput is a lot less than one would expect. In tests I've done, the improvement was only 13% with the normal mix of packet traffic over 1200 baud. Half duplex packet radio has characteristics that don't correspond well with telephone modem experience.

To do 9600 baud packet with voice grade radios, you have to make a couple of modifications to the radio. You should bypass the audio stages of the radio and inject your packet signal directly into the modulator and extract the signal directly out of the discriminator. The audio shaping done in normal voice radios, and the lack of low frequency response, will corrupt 9600 baud packets. There's also an issue of IF bandwidth. Some commercial service radios are too narrow or have poor phase response across the passband. This can cause problems at 9600 baud. It's not too difficult, but expect to have to do some surgery on your radio to use 9600 baud to best effect. Add in modem boards run around $90 for the common G3RUH design.

19.2 kbaud is in some ways easier to do. You can use a Kantronics D4 radio as an RF modem. Simply feed the TTL level data from the TNC modem disconnect directly to the radio and take it's TTL output directly to the TNC. This uses the radio as a raw FSK system. It works fairly well. A data scrambler and a tracking data detector would make the system more immune to drift, and a modulation scheme more complex than raw FSK would occupy less bandwidth, but it'll work as is. I think the D4 is in the $350 price class.

When you reach 56 kb, voice radios are out of the question. You must use a dedicated RF modem such as the GRAPES 56 KB system. It uses MSK modulation to present a narrow bandwidth for the high data rate, 1.2 Hz per baud. This means that a 56 kb data stream can fit in a 70 kHz spectrum. It includes a data scrambler and tracking data detector to retain robust characteristics in poor thermal environments. It can track drift of up to 20 kHz. The kit costs $250 and you need a transverter to convert from it's

28 MHz output to a UHF frequency where 56 kb is legal here in
the US. We use Microwave Modules, SInclabs, or SSB Electronics
transverters, but any linear transverter should work. Cost
varies from used MMTs at $150 to new SSB units at $750. A
possible cheap solution is the transverter sold by Down East
Microwave. The kit is around $100. That would give a total
kit price around $350. Note that the modem/transverter *is*
the radio so you don't need a separate radio to use this
system. That makes it cheaper than 1200 baud packet if you
have to buy a voice radio for 1200 baud.

>This information is to be presented to my group. I'd appreciate your
>input as to the BEST way to go based on price, upgradibility, etc. We
>are trying to look at as many angles as possible.

Start at 1200 baud with the built in modem of a TAPR compatible
TNC and use existing voice grade radios. This gets you started
with a system that is compatible with the majority of packet
users. As your need for speed increases, add the 9600 baud modems
and modify your voice radios, or jump to the Kantronics D4 or
the GRAPES kit. Note that when you leave 1200 baud you are cutting
yourself off from the majority of current packet users. Buy the
faster systems in pairs so you'll have someone to contact.

As Queens is physically part of Long Island (although politically part of
New York City) you might want to call my system.

I operate a multi-user PBBS which is accessible both over-the-air and via
telephone. The phone modem supports 1200 to 9600 (V.32) bps. When you
call please wait for the welcome screen before you press any keys.... Even
pressing <Enter> can confuse the system.

the number is 718-956-7133.

The Computer Networking Conference was excellent! There was much
"cross-polination" --- people with different networking approaches all
shared ideas and agreed to work together as much as possible.

There were many excellent papers presented, as well as vendor
demonstrations, discussions, good food, etc.

As usual the Proceedings are available directly from ARRL HQ

(203-666-1541). I recommend getting a copy in order to see some of what was discussed.

BTW, I'm Vice Chairman of the Radio Amateur Telecommunications Society. We hosted this year's CNC, so of course my opinion may be considered biased. Hopefully others will post their opinions as well so you'll get a broader view.

I have a datacomm question with regard to high-speed modems like the GRAPES (56 kbps) design. When it comes to actual implementation, if you're using these modems for high-speed point-to-point links, I can see where it's worthwhile to go to a fast modem. However, it appears that most of the hardware that supports these high-speed devices (including the NOS drivers that support DMA) are half-duplex.

Once you get outside of the engineering labs and the text books, what is the real performance gain of high-speed modems in the CSMA environment? Even if a radio takes 10 milliseconds to be on frequency (FAST for ham equipment), it still takes a modem a finite amount of time to acquire the rx signal and then recover clock. If you are sending "typical" ham packets (let's say, for the purpose of this discussion <1k), then you are sending for less than 150 milliseconds at 56 kbps. That's not very long. Can anybody quote how much time it takes for the modem clocks to lock and be ready to send data, from the time the squelch opens?

Is the CSMA environment what these modems are designed for, or are they really intended for point-to-point so-called "backbone" links?

Just trying to learn.

Chris

Both. In interactive mode on a contending channel, they feel like
a Telebit in PEP mode, a little jerky, but usable. It's when they
do file transfers with long packets, typically 4k, on a non-contending
channel that they really shine of course. The modems are designed to
be capable of full duplex operation, and with a Gracillis board they
can be operated that way.

Note that lockup occurs in under 5 ms for the RF modems, they are
the radio remember. You can share the channel with a lot more
users when the average packet is less than 300 ms instead of several
seconds in length. Like any contention system, total channel thruput
starts to degrade rapidly as the available channel time is used up,
but with fast packets, there is more effective time to use.

If you operate full duplex through a cross band digital repeater,
full CSMA-CD can be implemented. That improves channel thruput
wonderfully as the hidden terminal problem is eliminated.

I seem to be having difficulty getting an audio signal from the TNC to the
HT's TX audio input.
Does anyone have experience with this particular radio/TNC combination?
My cables are wired correctly as per the manual (and tested with a meter).
The TNC's analog loopback test works fine. PTT activates correctly, but
I can't seem to get any audio in the transmitted signal. When I run the
calibration function, I get no audio signal for either tone setting.
I have tried it throughout the range of the TNC's transmit audio level
resistor, and with and without the impedence jumper in place.
The HT works fine with the speaker-mike, so the jacks are working.
Someone has suggested that I need a capacitor between the TNC audio out
and the DJ-580's audio in. Is this true?
Receive is working just fine.

This packet beginner will greatly appreciate any advice...

Gary KE4ZV says:

The software and modem systems work at the lower speeds, but
tie up the resources of your desktop machine doing bit banging tasks
best offloaded on a dedicated processor. Disk interrupts and the like
can corrupt packets by disrupting the timing.

I say:

Note, that this isn't ture of the Mac SoftKISS system. Mac's are
blessed with a Zilog SCC, just like all the good TNCs, and can do HDLC
in hardware. The driver just replaces the serial port driver and can be
used by any program expecting a KISS TNC on the end of a serial link.

Hi,

I am currently in the US for 1 year and am looking into purchasing a 2M
handheld set. However, after this period I will be moving back to Europe and
I would like to operate the same set over there. Is there anybody out there
who may know how difficult it is to convert one of these so that it will be
able to use the European repeaters and the slightly different frequencies of
the 2M band ?

Thanks in advance,
     Dave Cullen (KD4RIB).

Please reply via e-mail.

Clarification: my computer attempts to directly open an SMTP connection to the recipient's site and deliver mail if it can find an IP address for that site. This does not pose a problem most often. However in one specific instance it did. I tried replying to a person whose address was "user@ucs.indiana.edu". My computer can find an IP address for ucs.indiana.edu, and attempts to open an SMTP connection to that site. That computer does not apparently have SMTP enabled, and my computer has been attempting to send that message for 2 days now. I would rather send this message to the SMTP gateway that I have defined, and let it forward the message.

I wish to thank all who have utilized the HAM Connection for HAM Files and other information. To date, I have recieved no flames concerning my occasional posting to inform this newsgroup of its' availability to all free of charge or obligation. However, one person on the net seems content to keep reminding me of my posts and seems to point to every flaw my postings may have. I am very sorry this gentlman feels this way but I can't change his opinions. He is entitled to that. I still can't understand why someone would keep trying to mention that my short posts about the BBS will cause flames when I have recieved none. So, I can put an end to his posts without arguing with him or others by shutting the system down permanently. It was offered to those who do not have FTP access so they too, could enjoy the many HAM related files that are available on Internet. But effective Thursday, December 10th, 1992, the System will shut down at 18:00 PM CST. I wish to thank those individuals who used the system and I truly hope that you enjoyed using it. For those who wished to continue using it, I am very sorry it must cease to exist. My deepest apologies for posting a message concerning its' availability. I am sure Gary at N8EMR BBS must feel guilty for posting messages concerning his BBS too, if he had recieved the same type of e-mail I have concerning my post. I wish his BBS luck and He in no way was the one who kept pointing to my post. In fact, that's between God above and myself. 73's all and happy holidays.

Is there a gateway from 2m to Telnet in the Dallas area? If yes, what
are the frequencies on 2m?
If no, is there a University having acces to Telnet and providing modem
acces?
I have a PC with NET(KA9Q) running connected to a TNC ready to be
connected.
All I need is a connection to Telnet as a backbone to Europe.

Any hint is appreciated.

Here's what I know about cheap packet systems:

As I understand it:

1. The BAYPAC (model BP-1) (page 140 November 1992 QST, or page 83
   November 73, $50) is a small modem that draws its power from the
   serial interface. It must be very similar to the TCM3105.ZIP
   schematic. (Also see BAYPAC review in December 1992 73)

2. It is just a modem, and therefore requires some software like
   BAYCOM running on a PC-compatible to complete the "TNC" system.
   The BAYCOM system was reviewed in the December 1991 issue of 73.

Summary of Inexpensive 2m Packet Systems:
---

1. For PC-compatibles:

A. Poor Man's Packet: (the authors are on internet)
   I. Page 8 August 1991 73 magazine.
   II. Anonymous FTP: helios.tn.cornell.edu (128.84.241.2),
   /pub/PMP/pmp11dsk.zip .

B. BayCom revision 1.50a software and either BAYPAC or use the
TCM3105.ZIP Postscript schematic:
   I. Review: December 1991 issue of 73.
   II. Anonymous FTP: WSMR-SIMTEL20.ARMY.MIL (192.88.110.20) or
   mirror sites like OAK.Oakland.Edu (141.210.10.117)
   wuarchive.wustl.edu (128.252.135.4)
   ftp.uu.net (137.39.1.9)
   nic.funet.fi (128.214.6.100)
   src.doc.ic.ac.uk (146.169.3.7)
   archie.au (139.130.4.6).

   I have used wuarchive.wustl.edu (128.252.135.4):
   /mirrors/msdos/packet/tcm3105.zip and
   /mirrors/msdos/packet/baycom15.zip
   (=BayCom revision 1.50)

   The later revision 1.50a is available from ucsd.edu :
   /hamradio/packet/baycom/baycom15.zip (168789 bytes)
   and also an ENGLISH manual for rev 1.2:
   /hamradio/packet/baycom/manual.zip (42424 bytes)

   The later revision 1.50a is also available from
   garfield.catt.ncsu.edu (152.1.43.23):
   /pub/hamradio/programs/baycom15.zip (168961 bytes).

   Note: Some older versions of the tcm3105.zip schematic
   have 2 R2s. I think the "R2" connected to the
   CTS line should be corrected to R3, a 2.2K ohm.

2. For Macintosh:
   PacketMac Modem: (the author is on internet)
   Page 8 October 1992 73, and errata page 54 November 1992 73.

3. Commodore 64: I was told:
> Digicom 64 in the August 1986 73 (date ??).
>
> The software is public domain and is usually bundled with a
> "kit," PCB, hard-to-find parts, etc.; from some hams that
> translated the original documentation from the German.
>
> A more-or-less accurate list of the guys that can supply the kit
> is listed in the ARRL publication, "Gateway to Packet Radio."

Notes:
---

1. I have only used Poor Man's Packet, but hope to try BayCom soon.

2. If you have Internet mail but not FTP, try the FTP mail server:
   send a mail message with the subject "help" and a single message
   line "help" to ftpmail@decwrl.dec.com.

3. (I have uploaded the "AX.25 Amateur Packet-Radio Link-Layer
   Protocol, Version 2.0 October 1984" specification as ax25.doc in
   /hamradio/packet/tcpip/incoming on ucsd.edu . If you have problems
   getting the file, I'll be pleased to email it to you.)

Please email me or post any additions/corrections.

Here in North Wales we are trying to establish a high speed link across the

whole of the coast from England, hoping eventually to carry most of the
Irish traffic as well. We have a multi-hop standard NET/ROM route and that
is currently being upgraded. We hope to eventually cover the whole of the
North Wales coast in two hops using microwave frequencies and at least
9k6 data rates.

We see that the only way of doing this is in full-duplex operation. As you
rightly state, the key-up, receiver settling and modem locking times are
very long when compared with the length of a packet. It makes the high data
rate, particulary when considering the cost of the kit, a waste of time.

We suggest that, if you want to dramatically improve your throughput, you try
a full-duplex link at 1200. You will be so amazed at the increase in traffic
that you will certainly want to try higher data rates.

One note of caution, watch your drivers! In a previous 9k6 link we found
that an Atari 1040ST running PE1CHLs NET, acting as a 10 port node, including
the 9k6 link, outperformed a 25MHz '386 by a factor of 4! The PC was running
the BPQ code, but the tx schuduling in the prog is not optimised for full-duplex
work (John Wiseman, G8BPQ, admitted this when we asked him!)

Hi!
    I've got a Kantronics KPC-2400, but would like to use a faster modem (9600 baud) than the 2400 baud modem in the TNC (which never gets used anyway). I understand that most TNC's have some sort of external modem header that Kantronics TNC's lack. Is there some way I could add such a header to my TNC? What would it require? (I'm VERY comfortable with surgery on the TNC.)

    On a related topic, has anyone come up with a Baycom/Digicom/PMP style modem and software TNC for packet at 9600 baud? Or is this too demanding of most PC's? (I'm using a 386DX at 33MHz.)

    The 2400 is both more and less TNC than I want. It will do HF packet and WEFAX, but I have no HF gear. 2400 baud does work, but is not supported by more than a handfull of other operators in this area. I would be happier with a TNC2. Anybody wanna trade with something more like a TNC2? :)

Is the TNC jack on the back of the Yaesu 5100 just another mic jack,
or does it bypass stuff so you can run 9600 baud?

Wow, that's pretty amazing! I'm not sure you can do _anything_ on the net and not get some negative feedback, and here's a guy shutting down a useful BBS because of two instances of constructive criticism. Thanks for making my day just that much more surreal!

:+)

Concerning 1200 bps packet on an FM transmitter:

We are continually having problems with undermodulation, overmodulation,
and tone twist.

Is there a standard for frequency deviation for each of the two tones?
If so, what is it and where can I find it?

If not, let's discuss the problem....

Yes, if you insist on using NET/WRONG, the resulting short packets are
wasteful. The solution, however, is not to blame the modem, but to change
the transport protocol to use longer packets. Since there are normally
many transfers going on at the same time on the backbone, it's simple
for the switch to piggyback them together in a multi-frame transmission.
If you use TCP/IP for your transport protocol, and set parameters
intelligently based on channel capacities of the various ports of the
switch, you can achieve maximal usage of the bandwidth available.

Now full duplex channels can be marvelous thruput enhancers, and our
modem is designed so that it can be used full duplex, but half duplex
non-contending channels are also a great improvement for backbone
use when combined with a reasonable transport protocol. On our backbone,
we alternate between 440 and 220 for links to adjacent switches. This
gives us non-contending channels.

User LANs are best done with half duplex users aided by a full duplex
repeater. This sharply reduces the problems due to hidden terminals
and the resulting contention. With our modem, and the available
transverters, crossband repeating is the way to go since it eliminates
the need for extensive duplexer filtering. A user merely has to add a
receiving converter to his existing transverter to take advantage of
this scheme. That normally costs less than $70. True end to end full
duplex is unworkable with many stations sharing a common frequency
pair because there's no a priori way of determining who should be
on top and who should be on bottom for a given exchange.

I dont feel guilty.. I usually ask every year or so if people want to
see my ARRL and packet message postings. Usually they do and want more..
My monthly bbs message about system access is short and to the point..
I dont charge for system access and dont feel in the least bit guilty
plus each post generates a couple of new callers many or stop by from
time to time to pick up files and say hello..

It takes a long time to establish a bbs. Many BBS last only a very
short time, then people relize that they have to spend time and
money to operate a bbs... I just completed verifying bbs for my second
anual ham bbs list, to be published in spec-com magazine, and here
shortly after paper publication.. Unlike many of the people who posted
so called ham radio bbs list here and on fido my list contains has only
verified bbs. Several of the posted list had bbs's with phone numbers
over 5 years old. Others went for quanity not quality.. I called

over 600 so called ham radio BBS, under 200 were what i called a
usable ham radio BBS.. most of the bad numbers were disconnected,
many for over a year. Others were just hams running bbs with few
if any radio related files files.

Balloon Launch Report

I am sorry that it has taken so long for me to report about the balloon launch in Kansas. I have been waiting for a press release from the ham who was running it. I am still waiting but have decided to give out the information that I have.

The balloon was launched on schedule by WD0DRL and rose at an estimated speed of about 700 ft per minute. It is estimated that the balloon broke at about 100,000 ft. During the ascent data was received.

After the balloon burst, communication on the packet was lost at about 35,000 ft. With the help of several hams it was determined that the balloon landed about 57 miles NE of the launch site.

After about 30 minutes of tense waiting, the package was located and returned for examination. It has been determined the the packet stopped because the battery running it dropped below the required voltage.

Currently the data is being analyzed and another launch is being scheduled in January.

If I can answer any questions either post them or send them directly to me at my email address.

Thank you.

The amateur radio club here at Michigan Tech is considering changing
its packet BBS from MSYS to something civilised, but we need a system
that can still accept telephone forwarding from another MSYS system.
We are interested in any package that will allow message areas, and
is more stable than MSYS (it can't be any worse, can it?).

We would like to be able to take normal dial up connections, but we
can distribute software to our memebers if NOS, etc is necessary to
use the dial up BBS.

The most critical part of this is the phone forwarding since our only
connection to civilization (Houghton is in Michigan's Upper Peninsula,
really out in BFE) is the forwarding we get from down state, and he is
not going to quit using MSYS just for us.

I will be around next week, and then will be gone until after New Years,
so please e-mail responses unless they will get here soon.

73 and thanks a lot,

Thanks to all who responded to my plea for information on high speed
tcp/ip. You have all been very helpful.

I would like to hear any comments on the following.

I have decided that the first step is for me to purchase the MFJ1270B
TNC, as this seems to be popular and inexpensive. More importantly,
it seems to be compatible with the TAPR and GRAPES modems.

I am tempted to directly take the plunge to the 9600 baud option, but
I am not sure whether this will ever be useful to me, because few
people are using it. If I can use it, I'll buy it. Otherwise I am
tempted to run some tests at 1200, then make the jump directly to

56K.

If anyone can tell me MFJs address and/or phone I would greatly
appreciate it.
I'd also like the address and phone for the GRAPES people so I can
ask them some questions about the 56K modem.

Can anyone who is using the GRAPES modem let me know what their
equipment is and their experiences with it??

For starters, I would like to use my Tempo 2M radio for the RF
portion of the system. This radio has 10 watts output. Will this be
enough???

I live in Norwalk, CT (SW corner of the state). Can anyone tell me
who I would have to contact to find out about the local net here???

Next, I will need some software. I assume I can immediately use an
ordinary terminal package to do ax.25 to other stations with the
1270. For tcp/ip I need a router, which I believe is provided by the
KA9Q software, ie, the software supports a serial interface to the
TNC in KISS mode, with my lan interfacing through an ethernet or SLIP
port. Is this correct??

In order to do this I would have to run a PC dedicated to just being
a router??? I can do this, but I am interested in running the TNC
directly off my unix box, a NeXTStation. Has anyone ported the KA9Q
software to BSD unix or even to the NeXT specifically?? If source is
available, but not the port I need, I would be willing to tackle this
project and make my results available to all.

Are there any other options besides the KA9Q software, and what are
the advantages/disadvantages of those options???

Last but not least: I get the frequency of my local net, get an ip
address from the coordinator, get the TNC, raido, and router all set
up. Now what??? How do I find out who else is out there???

Thanks again everyone!

This is the 3rd CALL FOR VOTES for the creation of the rec.radio.info newsgroup.
At the end of this article is a list of blind tallies, acknowledging the
reception of your votes as of Midnight Saturday December 5 Central Standard
Time. If you are not in the list, and have sent in a vote before that time,
please resend your vote. The RFD was first posted on 28 October 1992, the
original CFV was posted on 23 November 1992 and the 2nd CFV was posted on
December 1st.

Voting has started, and will end on December 23, 1992 at 23:59 GMT. Votes
should be mailed as follows(*):

Yes (create rec.radio.info, as proposed): QSL@unomaha.edu or qsl@unomaha.edu

No (do not create): QRT@unomaha.edu or qrt@unomaha.edu

Case is not important (at least on the receiving end).

(* Voting mailboxes are amateur radio Q-codes for mnemonic purposes.
QSL = acknowledged, also loosely yes or affirmative. QRT = cease transmission,
also loosely no, "nix" or "86").

Votes that are posted or mailed to me will not be counted. Message bodies will
be ignored for tallying purposes.

Moderator at creation will be mark@ve6mgs.ampr.ab.ca (Mark Gregory Salyzyn)
using the address rec-radio-info@ve6mgs.ampr.ab.ca for postings, and
rec-radio-request@ve6mgs.ampr.ab.ca for administrative requests. Note that
the domain address of ve6mgs.ampr.ab.ca is replacing the ve6mgs.ampr.org
domain for reliability in mail forwarding.

Regular posters to this group will be deputized to moderator status to provide
timeliness, reliability and to keep the load down on the chief moderator.
There is no archive site arranged at the moment, however,
Lyndon.Nerenberg@unbc.edu has offered a site once installed in the coming
month. We also need a BITNET Listserver gateway if anyone is interested in
supplying one. Any offers to help moderate, gateway or archive this new group,
if the vote passes, can be made to mark@ve6mgs.ampr.ab.ca or
pschleck@cwis.unomaha.edu.

Please see the pertinent postings in news.answers and news.announce.newgroups
for the rules that will be followed in creating a newsgroup.

------- Charter --------
Newsgroup:
     rec.radio.info (moderated)

/usr/lib/news/newsgroups entry:
     rec.radio.info   Informational postings related to radio.

Charter:
     To provide high quality, informational postings about radio. This
     group will take cross-postings, or moderated postings from the regular
     discussion streams to alleviate the traffic, over expensive links, in
     these groups by allowing the news transfer mechanism to drop articles
     cross posted to rec.radio.info. Postings in the entire rec.radio.*
     hierarchy that the moderator(s) feel as informational, however, are
     likely candidates for cross posting or re-posting. Also by placing the
     informational postings in this group, make it easier for many to find
     radio related information.

     By maintaining a high level of quality in the postings, it is hoped
     that these postings may end up, at least more conveniently, in various
     archive sites, or possibly over the Amateur Radio Packet BBS network
     as well.

     By using a self-moderator scheme, the hopes are that many of the

postings will maintain timeliness, and good propagation through the computer networks.

I am looking for an ftp site for ANALYZE, as recently announced by wa6aeo @
wa6aeo.ca.usa
I have looked at ucsd, wuarchive.wustl.edu, but to no avail.
Any help would be greatly appreciated.

thankyou.

Call PacComm in Florida. They have a commercial all in one radio and
9600 baud modem/TNC product they will be happy to sell you. Their phone
number is/was (813)874-2980.

Is there an Acces /gateway from 2m to Internet in the Dallas area?
If yes on what frequencies?
Any hints would be appreciated.

Subject: English docs for TPK 1.80
Date: 21 Dec 1992 13:16 PST
Organization: TRIUMF: Tri-University Meson Facility
Lines: 18
Distribution: world
Message-ID: <21DEC199213163559@erich.triumf.ca>
NNTP-Posting-Host: erich.triumf.ca
News-Software: VAX/VMS VNEWS 1.41

A number of local packet users have started using the program "TPK ver. 1.80"
as a user terminal program for use with the F6FBB BBS. Unfortunately, since
the program was written in France, almost all the documentaion and help files
are in french. Does anyone know of a source for English documentation for this
program?

For those who haven't heard of it, TPK automatically collects message headers
and selected sorts of messages (eg. all @AMSAT, all SALE, etc) greatly reducing
the time a user is connected to the BBS. All message transfers are done in
compressed form, further reducing connect time.
(If we could read the docs, it would be even more useful!)

Hi There,

Does anybody know of a single chip implementation of an
FM digital reciever for something like a walkman.

I want to build a walkman and am looking to make it as
small as those in the market. If I have this single chip
implemetaion (reciever, tuner, PLL etc), it will make
my task easy.

Please email any information directly. If any of you need
the same info, I'll collate and post it.

Thanks a lot.

Anand

acornwal
From: acornwal@fox.nstn.ns.ca (andy cornwall)
Subject: Satellite Call Signs?
Message-ID: <acornwal.4.724983001@fox.nstn.ns.ca>
Summary: query pacsat/microsat call signs
Keywords: satellite,amsat,pacsat,microsat
Lines: 12
Sender: usenet@nstn.ns.ca (NNTP Entity)
Organization: nova scotia department of eductaion
Date: Tue, 22 Dec 1992 00:10:01 GMT

I am configuring PB.EXE for connecting to pacsat/microsat satellites, and have run into a snag. The program wants the variable bdcstcall given the call sign of a satellite. The info. I have available refers to the acronyms UO-22, KO-23, UO-14, LO-19, FO-20, AO-16, which do not seem to be call signs.
If you know what the call signs of these satellites are, will you please tell me about them.

Norman,

  I sent a message out, but since I have not heard a reply I must assume
that it didn't arrive. Could you hand deliver this message to get
information to me? My address is shown below, both Snailmail and UUCP.

Thanks - 73, Rick.

A friend of mine is looking to set up a remote digital link that can
support at least 19.2K full duplex. I figure that a pair of 56K GRAPES
modems can work, especially if they can go full duplex.

However, the software used is designed for a direct link, or optionally a
phone modem. So, using standard COM ports are required, and they are
already set up with NS16550AFN UARTs. We have done some testing with
standard TNC2s full duplex (wired and dual band rigs), so setting CONPERM
and TRANS will give acceptable results.

Does operation with the GRAPES modems change the way that TNCs operate,
other than the increased speed? I assume that there is a way to increase
the TNC to talk to the computer at 57600 or faster.

Anyone have any ideas?

Anyone who has experience with the HOKA Code3, please post your
impressions and opinions.

Does it do well with all of the modes it is advertised to handle?

What is the user interface like?

Does the automatic mode selection work?

Is there a US distributor?

Thanks & 73 de pete wb5kly

Packet software and COM4

I have used my telephone modem software, Telemate
version 3.1, for packet radio as well because I
have become familiar with that program.

However, it does not support binary file transfer
using Yapp-protocol. And all Yapp-capable programs
I have found in various Internet FTP-servers do not
like a TNC connected to COM4-port... They know only
ports 1 and 2 (and those two are needed for other
devices than tnc).

Would anyone know of a program that supports both
com3/4 and yapp file transfer? If such a program
exists, is it available to anonymous download from
some ftp-server??

73 and merry xmas,
Mika

    I was interested in the information recently posted mentioning a
9600bps satellite service broadcasting usenet news. I've been looking for
something like this for a while. I take it there would be some (possibly
insurmountable) problems in receiving the services mentioned in the UK.
Does a similar service exist covering the UK ?
    Please send any info to the address below as I'm very likely to miss

anything posted. Thanks,
Steve.

You need the YAPPB program with an external combios like MBBIOS. This
will work with any port/IRQ setting. Look in ucsd.edu and
tomcat.gsfc.nasa.gov for MBBIOS.

I had a HOKA for a very short period of time. Never could get it to

work properly. When I saw it demonstrated (live) at the Monitoring Times convention in Atlanta (last fall) I was IMPRESSED. Have since traded it for some spectrum analyzers, etc. This unit should be great if you live in Europe and want to "decode" some of the more bizarre diplomatic RTTY stuff.

Richard Crisp will probably respond to this post and since he has my old unit and the time and intelligence to fool with it, you can probably expect a bit more thorough rundown of the unit. It lacked even an on/off switch, but did include ghastly software. This is not a unit for the faint of heart. It also can present (the software) WEIRD symptoms. Mine would work (or appear to) in some modes, but not if I loaded DOSKEY in high memory. Some/many of the problems may be the result of quirky software.

Yes, they are designed to support full duplex operation. The RF board is arranged so it can be cut into separate receiver and transmitter sections and housed in different cabinets if desired for isolation. The data encoder and decoder are on separate PC boards.

Well the software and comport hardware issues are a problem. Remember
that the modem is a synchronous modem and supplies all clocks. So you
need a synchronous comm chip to support it. That typically means an
8530 in the PC, or a buffering TNC. If you wish to ignore AX25 and
just send raw duplex data, then a synchronous comm port is all you
need. But if you don't have a sync comm port or need to packetize
the data, then there are complications.

A soupped up TNC2 with our special KISS56 code can support the modem
at 56 kb on the RF side, but we've had problems stuffing the data
through an ordinary async com port at that speed so the KISS56 code
handles the data to/from the PC at 19.2 kb and buffers packets in it's
internal memory. That's ok for a shared channel because it can transfer
data on the serial line while others are sharing the RF channel at 56 kb.
But for full duplex contention free channels, it limits thruput.
Note we suspect the limitation is in the KA9Q async handler and not
in the TNC. Other software may work fine at this data rate. Laplink
and it's ilk run up to 115 kb over the standard async port, but in
half duplex mode of course.

With an 8530 talking directly to the modem, data flow is no problem,
but the PC software has to do the packetizing of the data if needed.
For 8530 cards, there are a couple of choices. The Ottawa PI card is
good, but only has half duplex DMA. That would keep it from supporting
full duplex full speed links. The Gracilis PacketTwin card can support
full duplex DMA.

For your application, I would suggest that you experiment with 56 kb
wired links between machines running the software you require. If the
software can handle 56 kb, then a soupped up TNC buffer will likely work.

Gary

Although almost everyone agrees on using about 3 kHz deviation on FM
packet at 1200 bps, there seems to be some disagreement about the use of
pre/de-emphasis. There must be someone who has gone through the
exercise of measuring error rates and/or noise floor and perhaps even
multipath tolerance for the four obvious permutations:
1. no emphasis
2. complementary pre/de-emphasis (6 dB/octave)
3. transmitter pre-emphasized, receiver flat
4. transmitter flat, receiver de-emphasized

How about it guys?

Sender: usenet@demon.co.uk

Good morning. It's Sunday the 27th of December and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- RSGB members have raised 4,500 for Albania; Raynet groups have been in action in Peterborough; and the January RadCom has been posted.

The RSGB Mencap Albania Appeal, launched last April, has raised more than 4,500 to help the mentally handicapped people in Albania. Full details, including prize winners, appear in January's edition of Radio Communication. The major prizes will be presented at a ceremony in early 1993 at which the RSGB's cheque will also be handed over to Mencap.

The Pentland South Pole Expedition is still ahead of schedule. Each man has to pull a sled which is now down to 300lb. The effort has lost 15lb body weight per man. Ran Fiennes and Mike Stroud are still in good spirits and are due at the South Pole in Mid January. Activity continues from Morag, GB4MSS/VP8 at the Patriot Hills base camp. We are sure that all those listening to this broadcast will join us in wishing the expedition all the very best for Christmas and the New Year.

January's Radio Communication has now been posted to all RSGB members. It includes a full description of the Licence changes regarding EMC, and gives details of the Radiocommunications Agency's new EMC Leaflet, EMC and the Radio Amateur. Details are also given of the latest licensing negotiations between the RSGB and the RA and there is a full report of the meeting between the RA, the City and Guilds and the RSGB to review the first year of the Novice Licence.

On the 14th of December Raynet groups in the North Cambridgeshire Area were alerted to a serious problem at the Peterborough General Hospital. Led by Roger, G6CKR, of the Four Counties Raynet Group, communications were rapidly restored within the Peterborough General Hospital where all telephone paging, cardiac arrest alert and similar systems had failed. Later additional Raynet operators were called in from Cambridge, Forest Heath, Leicester and many other surrounding groups with groups further afield being put on standby. The hospital systems returned to acceptable working condition the following morning and the Raynet operation was stood down. However, the telephone systems failed twice more that week and on both occasions Raynet installed local communications and supported the hospital administration. Altogether in excess of 675 man-hours and some 120 Raynet operators were involved in these three operations.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO. From Antigua, VE3BW will sign V2/VE3BW from Friday the 1st of January until Friday the 29th of January, on all bands, using mainly CW. From the Seychelles, I5JHW will sign S75S from Praslin Island from Monday the 28th of December until Sunday the 10th of January, on all bands but especially the WARC and LF bands, using SSB, CW and RTTY. From Gabon, TR8NSY is active on 40m CW after 2200GMT. From New Caledonia, FK8CR is now active on 80m for Europe around 1830GMT.

Rally news now and we know of no rallies planned until the 24th of January 1993.

Next a date for your diary:

The largest amateur radio exhibition in Europe, Ham Radio at Friedrichshafen, Germany, will take place from Friday the 25th to Sunday the 27th of June. February RadCom will contain full details of an organised trip from Britain to visit this prestigious event.

Some HF Contest news now:

RSGB LF Cumulative Contest sessions take place as follows: The 7MHz event is scheduled for Saturday the 2nd of January, from 1000 to 1200GMT. The 3.5MHz is on Sunday the 3rd of January, from 1600 to 1800GMT. And 1.8MHz is on Monday the 4th, from 2000 to 2200GMT. For further details see December's RadCom page 62. On the VHF front, there is still time to take part in the RSGB 70, 144 and 432MHz Fixed Station Contest, which started yesterday the 26th and finishes on Tuesday the 29th of December. The contest runs each day from 1400 to 1600GMT. See July RadCom for full details.

A reminder now to all Repeater Groups that if they do not wish to continue with the RSGB's public liability insurance after the end of March 1993, they must contact the RSGB's Repeater Management Group Chairman, Geoff Dover, G4AFJ either direct or via RSGB HQ.

The Central Birmingham VHF repeater GB3BM has now closed down due to problems of security at the site, and the repeater keeper has relinquished the franchise. The franchises for GB3BM and GB3AM in South Birmingham are now

vacant and any group of radio amateurs is invited to contact the RSGB's Repeater Management Group with a view to taking over either or both franchises. Application should be in writing to the RMG Chairman, Geoff Dover, G4AFJ, whose address is correct in the RSGB's Call Book. The Midland area repeaters GB3BX, GB3CF, GB3MH and GB3WK are now on time clock operation, from 0700 to 1800GMT until further notice.

And now the solar factual data:

This week due to the Christmas holiday we have had to forego some data. For the period 14th to 18th December with the active side of the sun looking our way, solar flux levels have remained high. HF band conditions were good up to the 17th, when a sudden storm commencement was recorded at Chambon La Foret, with a minor magnetic storm being predicted for the 18th but little came of it. A stratospheric warming was reported on the 15th over southern Siberia of 30 degrees, with the cold centre moving towards Greenland. Due to the recent heavy cloud over Italy the sun spot data is not complete, but spots appeared to mean about the 140s. No flares of any note have been reported. The solar flux levels remained high and averaged 154 units. The geomagnetic Ap indices were quiet up to the 17th when the SSC occurred which raised levels to unsettled, giving an average of 11.8 units for the period. The state has been nil, nothing to report, except the 'stratwarm'. The radio quality indices have been normal throughout the period with the Boulder Fort Collins and Tokyo circuits being up to excellent at times. The aa indices as reported by the British Geological Survey for the period 8th to 14th December gave daily averages of 27.4 nanoTeslas, about K3, with little change throughout the period.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, have been remarkably steady and averaged 10.8MHz. The darkness hour lows averaged 2.9MHz, though some very early morning periods of spread F were reported lasting up to 5 hours on some days.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg have remained high and averaged 10.6MHz, with the darkness hour lows averaging 2.9MHz. What price forecasts? Solar cycle 22 showed the steepest sunspot rise of the past 13 cycles, the forecasters had a field day with the one-year-ahead predictions being constantly updated to predict a very high or possibly the highest cycle. It did not happen. Since then, repeated forecasts have been way out, and the spread between the observed cycle and the predicted one has given the largest spread of any cycle so far.

And lastly the solar forecast:

This week, the quieter side of the sun will be coming into view, with solar flux levels are expected to be at about the 110s and quiet geomagnetic activity. Ionospheric conditions are expected to be good, with MUFs up to

30MHz during daylight, and 14MHz for the darkness hours.

And that's the end of the solar information.

Finally in the main news, SSL, has informed the Society that as of last
Wednesday morning, the latest callsigns issued were in the G0 S V
and G7 N Y series, and Novice calls in the 20 A E and 21 B I series.

You're listening to GB2RS, the news broadcasting service of the Radio Society
of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

>4. transmitter flat, receiver de-emphasized
>
>How about it guys?

I've done a lot of experiments with this. There are really too many
variables involved. Different brands and models of radios have different
pre-emphasis, different TNC modems have varying sensitivities to twist,
the audio stages in the radios have different responses, and the IF/detectors
have different responses.

(1) is best if you can get everybody on your network to do the surgery on
their radios. This gives the most consistent results since the audio

stages of the radios are bypassed and you don't have to worry about what the manufacturer thought was a good value for the pre-emphasis. The only variable becomes the IF/detector linearity, and that's usually quite good over a 3 kHz swing. Note that your TNCs will have to be able to work with unsquelched radios since picking the signal off the discriminator bypasses the squelch. This is a plus anyway since several brands of radio have very slow squelch and that impacts TxD settings for everyone on the network.

(2) is practical reality because people don't want to add wires and connectors to their store bought radios. You know, the people who keep the boxes and wrappings so the resale value won't be harmed, the same people who are afraid to drill holes in their cars. Performance will vary all over the clock, but that's the way it is.

(3) (4) these are just plain bad ideas that will guarrantee twist.

Gary

I've heard as part of HAM radio folklore that the maximum legal packet length is 256 bytes. I've had a hard time believing this after looking through FCC pt. 97 rules or the ARRL version with expanded explanations. It would seem to me that if you wanted to, you could set up a full duplex link transmitting/receiving a continuous stream of data as long as the system(s) ID every 10 minutes. This is intended only as an extreme example, not necessarily a practical one.

I've combed through the rules throughly (I think) and can't find anything to stop me from using let's say a 4K packet size simplex to another station set up to do the same. Anyone have concrete info?

OK,

Is there some type of publication that will help me with these questions: (I have read the PACKET FAQ and GETTING STARTED WITH PACKET.)

1.) I there something out there that will explain to me Advanced Packet radio. (TCP/IP, AX.25 and "THE NET")

I understand computers and packet radio but I haven't been able to find out the ADVANCED PACKET STUFF. I would like to know more about connecting my station to the/a TCP/IP network and things of this nature. It's kind of like when you get the INTERNET in your office for the first time you don't fully understand it. Then you find out all these great things to do. I want to find out more about the great things out there for PACKET RADIO.

HELP PLEASE,

-NICK KA1NIP

I was asked a question the other day that I couldn't answer. Could a SYSOP of a landline BBS install a "DOOR" that would allow "LICENCED AMATEUR RADIO OPERATORS" access a packet gateway through him/her? The sysop being a "LICENCED AMATEUR RADIO OPERATOR" of course.

>
> [Ohio experience deleted...]

In the Mpls/St. Paul metro area, we went through the pains of subnetting about 1 year ago. We subnetted by frequency (we reasoned that a frequency was roughly equivalent to a network, even though it may not be 100% fully connected.) For instance we use 44.94.249.x/24 for the 1200 baud frequency where most IP activity occurs. The routing tables are much more manageable now, and a little education on how & when to use RIP (and when not to) worked wonders. We tried RSPF, but everywhere it would have been useful, it couldn't be used, since it didn't work on more than 1 port at the time.. Some observations :-

When giving out IP numbers you get really strange looks when you ask what frequency someone intends to use.

Don't rely on an MSYS node as a gateway to a subnet. Currently it
does not support multiple IP addresses, and the routing is still
done by hardcoding the arp table.

I don't want to give the impression that it's perfect, but I believe
subnetting really pays off - It's best to do it as early as possible,
you feel a little stupid making a subnet for 2 stations, but it's
easier to change when there are fewer (probably more motivated) people
involved..

Hope this helps.

>
> Alun.
>
> p.s. I have looked on the buffalo ftp site but couldn't find it there...

I have received replies from the following people (in no particular order)

G|ran Bostr|m Goran.Bostrom@se.infovox
Ted Cline tcline%com.hp.lvld.hplvec@uk.co.hewlett-packard.hpl
Pat Masterson bat@com.grumman.gdstech
Jon Vander Hill jcv26@org.cas
Bradley T Banko btbg1194@edu.uiuc.cso.uxa
Adrian Godwin agodwin@uk.co.acorn
Kevin Purcell a-kevinp@com.microsoft
A.R.Bateman cs9h0arb@uk.ac.swan.pyr

The following sent me copies of AX25.DOC, which as Ted Cline noted is
available by mailing him directly:
Ted Cline tcline%com.hp.lvld.hplvec@uk.co.hewlett-packard.hpl
Pat Masterson bat@com.grumman.gdstech
G|ran Bostr|m Goran.Bostrom@se.infovox
Jon Vander Hill jcv26@org.cas

Bradley T Banko (btbg1194@edu.uiuc.cso.uxa) suggested:
You might just dig up the sources to the Poor Man's Packet computer TNC
with modem (available around the net "archie pmp")... it includes some
pretty well documented C source subroutine files for AX.25.

Adrian Godwin (agodwin@uk.co.acorn) pointed out that the NET package
has already been ported to Acorn's RISC OS machines, requiring a KISS
modem and not much else. He also suggested looking at pmp, and suggested
looking on ucsd.edu for KA9Q stuff.

Kevin Purcell (a-kevinp@com.microsoft) suggested:
You can find find all you need to know in a booklet published by the
ARRL called "AX25 Link layer protocol specification revision 4". I have
a copy at home but can't remeber the title exactly.

You should be able to buy this from folks who sell ARRL books (like the RSGB).

Its very dry reading (like all good specs) and provides a description
of a state machine which defines the protocol, so it shouldn't be too
difficult to implement directly.

A.R.Bateman (cs9h0arb@uk.ac.swan.pyr) suggested:

I'm not sure about an on-line source for the AX.25 protocol, but the reference
I got was from the RSGB. It is a reproduction of the full protocol specification
document and was about 5 pounds I think.

In view of the above I have decided to follow two courses in parallel.

Firstly I am trying to use AX25.DOC and the PMP sources to write a
quick and dirty packet implementation based on the Baycom board design.
(Don't hold your breath, all you Acorn users - I have a lot on my plate!)

Secondly the KISS modem sounds like a more sensible idea, as I didn't
realise how stringent the real-time constraints will be generating the
HDLC directly from software. Besides bit-stuffing is boring ;-)

Thanks to all who replied, all your help has been greatly useful.

Alun.

p.s. I've re-started reading this group now...

Question.
I was told the other day that TAPR has a modification that optimizes
the KAM for HF operations.
Does anyone know anything about the mod or a telephone/email etc
that I can contact to find out about the mod?

Thanks

Hi ...
     I wrote an article in Radio Fun (November, 1992) that describes the
land-line port we run on our Club PBBS. It is open to ANYONE, licensed
or not. We hold any traffic from the annonymous check-in. If we can
verify the traffic left by the unlicensed user, I change it to go out
under my call as third party traffic. (Some recently licensed Sysops
have crabbed about such activities ... apparently never hearing of
such things as third party or NTS.)
     We have about fifty licensed people who use the port. Many new
RF packet operators have started on the land-line port.

73,
Steve

Does anyone have any source code for the PacSat broadcast protcol
that they could send me. I am working on some software to deal with
the images from the sattellites and need to implement this protocol.

Greetings:

Well, after several years, I'm finally getting the packet bug again and
dug out my trusty (maybe that's crusty) ole' MFJ 1270B and I can't find
my manual. I've got everything hooked up from memory, but my big
problem is that short of CONNECT, DISCONNECT and MYCALL, I can't remember
any of the commands. I realize I can call MFJ and they'll probably
send me a manual for a few bucks. I'll probably do that, but I'm
impatient. I can't wait that long. I wanna get on NOW!

I'd appreciate anyone who has one of theseending me a quick command
recap, so I can get started again.

73,

Dave

 Hello!
 I don't know if it is the right newsgroup to post it.
 I know there are satelites done by hamradios,which can be used with a
 computer and special hardware.I also know there is a "Email" system
 which works on this satelites,for Hamradios.
 My question is if there is ANY way I can mail a ham radio using this
 satelite,of course without needin a radio transmitter.I want to mail
 the satelite somehow through Internet(or Bitnet??), or,if it is possible,

to mail the person himself.
Thanx a lot!
Livian
P.S.:
1.I am talking about the Oscar type satelites.(Or others like it)
2.I know the persons adress.(on the satelite?)
3.The person is NOT connected to Internet,of course.
thanx again.
P.P.S: Please mail the answer to me,not to the newsgroup.

>information in it for each county and the voting information for Michigan.

We initially attacked the problem of subnetting geographically, but found
that to not be completely satisfactory. Physical location and RF connectivity

rarely coincide in our terrain. So we subnet by RF LAN. We have 56 kb, 9600, 2400, and 1200 baud LANs, and each type exists on several distinct frequencies with switch nodes at several different locations throughout the state. Each station decides, based on equipment and RF path, which LAN it wants to operate in, then it's assigned an address for that subnet. The 56 kb backbone handles interlan connections automagically. There are still large geographic areas of the state, where ham population is low or uncooperative, that have to digipeat into a LAN to access a high speed switch, but that's life in a funds and manpower limited activity.
We hope that the new The Net/IP code will eliminate digipeating in the near future for those in the hinderlands. We've been stalled trying to establish a 56 kb link East from Atlanta to the coast for a couple of years by lack of suitable local manpower to maintain a relay switch site. On the other hand, we've had little trouble pushing links North and West from Atlanta into Tennessee and Alabama. Finding local manpower to maintain parts of a large geographic network is the number one problem.

>-Nick KA1NIP

Sure, but the sysop would be trusting his/her license to the good behavior of those using the gateway.

Another alternative is what I do with my BBS. It's primarily a packet system, but does accept telephone users. Anyone can call and read messages, download files, etc. They can also post messages, but everything posted is held for my review before it is visible to others (or forwarded).

I have several non-amateurs who call regularly, in addition to many hams
who prefer the speed of a telephone connection at 9600 bps.

Hello everybody!

It's nice to see the requests for PAX pouring in. One of the people
who requested a copy is Brett Breitwieser, but my message to him
got bounced back from an intermediate node. The transcript is appended;

   ----- Transcript of session follows -----
>>> HELO netcom.netcom.com
<<< 553 Local configuration error, hostname not recognized as local
554 <lancelot@cruzio.santa-cruz.ca.us>... Service unavailable

Can someone help to get this msg across to Brett? (Brett, if you're
tuned in, would like an alternate route to you. The netcom node seems
to be behaving strangely). Brett's address is lancelot@cruzio.santa-cruz.ca.us

If you run >256 bytes on a "standard" AX.25 frequency, chances are that you
will incur the wrath of those folks whose firmware pukes when presented with
said packet lengths. Otherwise, crank it up!!!

>

     Absolutely. This is the point of subnetting, without it,
it's just a method of administrating the address space. With it,
implemented correctly, it makes routing (for the usual 'leaf' nodes)
a piece of cake. For subnetting to be useful, it is essential that
everything on a subnet be able to talk directly. I would guess,
not being a packet expert, that the usual '3rd octet' approach to
subnetting is too limited. If there are 8 stations that can all
reach one another, and a main router, reliably -- but can't reach
anything else, they should be on a subnet masked 0xff.ff.ff.f8, for
example.

     The basic idea is 'if it's on my subnet, send it direct,
otherwise use routing tables (typically, pump it down the default
route)'

I need info if it's possible to build 9600bps modem using TCM3105.
Maybe just replacing crystal ? (4.43MHz to app.30Mhz).
Note:
It ISN'T necessary to have any standart format (just to connect two PC).

Maybe someone has circuit of 9600 modem based on other chip.
Any suggestions will be helpfull.

Thanks in advance

Part 97.109(e) specifies that AX.25 version 2.0, 0ctober 1984 must be used for automatic forwarding of third party traffic. I can't find my AX.25 reference, but I would the only *legal* restriction on packet size would stem from adherence to the AX.25 v2 spec. This only applies when automatically forwarding third party traffic, of course.

Perhaps I'm full of waste - but doesn't classical Internet routing depend
on subnetting by LAN, where a "LAN" is a group of stations that are
directly connected, or within ARP of each other? Anything else requires
smart routers everywhere, doesn't it?

The packet connector standard was submitted by me a few years ago as
a 'concept'. To my knowledge, no one has ever really done a packet
connector this way. I may start developing something more concrete
if there seems to be a need.

I am interested in hearing more about the COBRA standard you mentioned.
Could you give us details?

Roland, 7J1AKI/WF4P asked in Packet-Radio Digest #312 for information on a
TAPR modification for otimizing the KAM on HF. I assume that he is talking
about the TAPR DCD State Machine modification. This will dramatically improve
DCD operation. For the KAM, the optinalonal clock is also required. You can
obtain further information by em-mail to me ; e: rnielsen@tapr.ampr.org, or

I've purchased many items from Jun's in the past, and will continue to do so. I've found them to give me good service as well as among the best prices of any of the mail order places.

Unfortunately, most of the ham stores don't have a return policy as liberal as Radio Shack, and most computer stores aren't any better. A 10 day return with a 20% restocking fee is the norm anymore, and some places won't even accept a return after the ten days.

So, don't single out Jun's; they are following what is more or less the industry norm for bottom-price sales outlets.

Unfortunately, they have as much a right to be on that frequency as you do, so your options are very limited. We had a situation in the Pittsburgh area where all the PBBSs were on 145.03, with the long haul and keyboarders on 145.01. Then the sysops went to local forwarding on a 220 freq (forwarding only, no users), which helped a lot.

Eventually, we went to a "cellular" approach, where there was one BBS per frequency per region. There was then very little need for digipeaters, as most people were able to hit their local board directly. Those who did not have a board to hit locally were able to use one of the high profile digis on .01 or .03 to get one of the remaining boards on those freqs.

There was one instance of a sysop who made a total annoyance of himself, but there wasn't much anyone could do. So, his mail feed was cut, and he quickly came into line.

So, basically you can either move, or try to convince him to come into compliance.

Hello,

  I've been wanting to get into packet radio, but I have so many questions,
that I wouldn't know where to start. Is there a FAQ list that I could read
about for packet radio to get started?

  Thanks,
   Dan

Has anyone heard of the BayPac BP-1 or something like that?
I saw it in the back of QEX magazine, and it is supposed to
be a 1200 baud modem/TNC.. this thing is SMALL (the size of
a RS232 converter plug), and only costs $50.. Has anyone heard anything
about this? I figure I should try to get some feedback on this
model before I buy it.. It seems like a deal to me.. Thanks!

>get it?

     I have gotten it in one of the intervals between netstorms
and placed it on moink.nmsu.edu, 128.123.4.58, in pub/amiganos. This
is a public service, in an effort to please someone who can send me
some documents, or give me some hints as to how to persuade AmigaNOS
to initiate a SLIP connection! I am attempting to set it up for a friend,

and cannot find an analogue to 'tip' suitable for manually initiating
the connection -- this is necessary, as the local SLIP server assigns
addresses dynamically (I suppose a really clever dialer could do it
too).

     Has anyone done this? Halp! Halp!

          Andrew

Here is a mod which you can try out to get your FT-23 working on
packet. The FT-23 handie has an auto-save feature which cannot
be disabled from the keyboard. Hence, a tendency to loose
incoming packets sometimes. Jumper 10 on the control board is used
for the SAVE feature. Disabling this jumper is all you need to
do to shut off the auto-save and get on packet.

Yes, but you assign IP addresses according to what RF domain (repeater) they belong to, not which geographical area. A (bit-regen 9k6) repeater may provide coverage to nodes that overlap geographical boundaries, but to allocate different subnet addresses to nodes sharing one repeater seems silly. And what if a user has ports on two repeaters/subnets?

>
>The proposal that Jeff Townsend, WB8LYJ, came up with for Ohio after he

>location.

This all assumes that your users are not using RSPF or any other routing protocol and have only ONE port on their system. If a user has more than one port, the routing then gets impossibly complex if you are going to start typing 'route add ' anything...

>
>So, you have a geographical structure that simplifies wide-area routing,
>with local subnets that are fully connected around a switch or server.

aren't all all NOS nodes switches and servers ??

a Question:

 How do you fix the 'hidden transmitter' problem ?   Users 'homing' to a central switch sounds like (the bygone) days of digipeaters and CSMA on a simplex channel.. ;-) but seriously ;-) how is the hidden transmitter problem being solved ? I like the idea of two (one) 9K6 modem back to digital back replacing the audio stages of a UHF repeater (standard bandpass notch-reject type) triggered by a STATE-DCD in the modem.

Digitally,

Steve - ZL1BHD

I boutght one and it came with the Baycom 1.4 software. It works fine.
Yesterday I tried version 1.5a on it and it works very well also.

I am using it with an old pc xt (Phillips). The disadvantage of this setup is
that you have to leave the pc on all time if you want to receive mail.

Couldn't agree more. I have also purchased from Jun's with good results.
The basic situation is: the lower prices offered by the mail order places

are based on not having to deal with customers a lot. Read: not having
"good service". Most people understand that going into the deal.

However, none of this explains the item bought as new which was in
fact obviously not new.

Greetings,

Does anyone know where I can ftp the latest THENet X1H kit from?

Thanks in advance.....

I am looking for the most current version of the Baycom software for the
IBM PC, or another software package that works with a Baycom type modem. I am
using a Digicom 64 modem converted from my Commodore 64 for use on my IBM
type computer. Any help would be appreciated

     I made a new cable fr my MFJ-1274 and it wouldn't
transmit. It was working before but when I went back to
the original cable, which I also made, it was still putting
out only a carrier. I tried all different resistor values
but with no success. Is it possible I fried the modulator
or a transistor by introducing a short to the cable while
it was transmitting? Someone suggested so but it seems
unlikely to me. I don't have the proper equipment or the

service manual to test the output of the mod. IC here. I
have always received tons of help here, so thanks again in
advance.

Wouldn't a simpler fix be to set the squelch so that it is always open?
Radios dont go into auto-save if the squelch is open, and the TNC can
tell the difference between noise and packets, so everything should
work just fine if you dont plan on listening to the output of the radio

by ear.

Hi,

I have some central questions about connecting
two hosts via some protocol, without using
the telephone-net :

I want to connect two or more hosts (running
Unix) with either TCP/IP or ka9q or something
by transmitting the data 'through the air'!

So I wanted to know, what hardware equipment
I will need, and I also wanted to know what
is the correct term for this (ham-radio?
packet-radio? cb?)

Anyway, I don't want to spend too much money
on the radio hardware (less than DM 300, that
are US$ 200).

I intended to use so called CB-units (don't
know the correct english term).

So, if you have some material about this
or if you can answer my questions or if
you can tell me where to find a FAQ for
tis group, please emal me or post to this
group...

Hell, why restrict it to licensed amateurs ? As long as you are around
to be the "control op", and you aren't violating third party agreements,
any schmuck could use it. Sometimes I rig up my PK232 to be driven
directly from a modem, and let a non-licensed person play around with
it. It is a good way to introduce people to amateur/packet radio.

It sounds like you guys (generic) have a lot of fun. I've played with
most of the stuff you talk about execpt the RF part. I think wireless
is an exciting way to communicate, but need to know where to start.

Before I changed jobs, I was talking to a ham who was going to get me
information on the "technician" class license. He really prefered that
I go the whole 9 yards (as he had), but I really want to start with
packet and then ...

Any pointers? There must be people here in Greensboro, NC.

Thanks
jck

Garnet's suggestions is excellent, but whether it will work or not depends
upon the TNC one is using.

Some TNCs support open-squelch operation, some don't, and some do with an
add-in board (for example -- PacComm's DCD upgrade board which works with
many manufacturers TNCs). When operating open-squelch many TNCs will
"false" on the noise, generating Data Carrier Detect (DCD), and inhibiting
transmit.

I have successfully used my FT-23 and FT-73 HTs on packet, open squelch,
with my Paccomm Tiny-2s with the DCD upgrade.

So, give it a try -- but if your packet station doesn't transmit even when
the frequency is clear you might look into getting a DCD upgrade for your
TNC.

If you are looking for better software for the PC, try LAN-LINK. I wrote it.
It's available by anonymous FTP from many sites, including Tomcat, and UCSD.
You get a full version with all features and bugs (if any).
It is shareware so you can try it. Once you've tried it, then decide if you
want to register and pay for it, or to purchase shrink wrapped programs that
you cannot try out before you pay money.
Latest version is 2.00A

Balloon Launch with Packet Payload

2nd launch from WB0DRL EM18ct (Central Kansas)

When : November 29 (Sunday) 9 AM CST

40 meter net control 7.232 WA0TKJ Net Operator

This unmanned balloon launch is designed to gather
upper air data. Data will be downlinked via 2 meter packet
on 144.105 Mhz. Burst altitude will be 100,000 feet, 1.5
to 2 hours after launch. Telemetry will include outside
and inside air temperature. Absolute pressure readings, G forces,
battery voltages and sun position sensors.

The information in the packets will be as follows:

Seconds 120.04 Frame 41 Beacon:OFF Camera:OFF F 113 B 113 L 113 R 113
Out-273.0 In 80.6 Pres 0.0 Gs 2.321 Batt1 13.1 Batt2 2.18 A/D 2.20

Seconds - Time since launch
Frame - Packet number
Beacon - OFF/ON
Camera - OFF/ON
F B L R - Front, Back, Left, Right Sun Sensors
Out - Outside air temperature in degree C
In - Inside air temperature in degree C
Pres - Pressure in millibars (or) altitude in feet
Gs - G force
Batt1, Batt2 - Battery 1 & 2 Volts
A/D - A/D converter voltage

Packets will be sent every 10 seconds. The 40 meter net will
have more up-to-date information concerning direction of
travel, TNC parameters and launch site conditions.

Listen for the net starting at 8 AM CST

WB0DRL is being assisted by several members of the Central Kansas
Amateur Radio Club and the Kansas State University Salina Amateur
Radio Club. The software was written by N0SMR.

A photo of WB0DRL's ham shack (the launch site) was on the
cover of the April 1992 issue of 73 Amateur Radio Today
magazine.

I would appreciate any reception reports that anyone could send
to my e-mail address.

MIDWEST DIGITAL CONFERENCE '93 ANNOUNCED

Minneapolis, November 19 - The TwinsLAN Amateur Radio Club of Minneapolis/St. Paul announced today that it will host the second Midwest Digital Conference on Saturday, February 13, 1993. TwinsLAN president Max Wendel, N0FKU, said the conference, scheduled from 12 noon to 8 pm, will be held at the West River Point Business Center, 1315 N. West River Road, in Minneapolis. The event will again follow the Midwinter Madness Hamfest to be held the same day in the Twin Cities. "This is a perfect opportunity for attendees to relax after the hamfest, learn more about digital communications techniques and get together with other amateurs" Wendel said.

Conference chairman Carl Estey, WA0CQG, said the conference will offer numerous seminars on digital amateur communications. He said that "last year's conference focused exclusively on packet radio. This year we will address modes such as RTTY, AMTOR, PACTOR and packet with plenty of information for both newcomers and experts."

Estey said the topics will include digital operations, getting the most from a TNC, Local and Wide-Area Networks, and basic and advanced TCP/IP protocol. Speakers were not announced; however Estey said he expected some well-known digital authorities to lead programs. A banquet is scheduled from 5 to 6:30 pm. A get-together for sysops and netops and a shareware-

software exchange are also planned, according to Estey.

Tickets are $16.00 before February 13 and $19 on the day of the conference; the price includes dinner. For additional information and tickets, contact Paul Ramey, WG0G, 16266 Finland Av., Rosemount, MN, 55068, (612 432-1640.

I was wondering how the internet/ham gateways work. Do they just collect and then periodically forward email or are there actual real time connections into the internet?

Also how expensive would a basic packet radio setup cost (excluding the computer :))

I have been having a few problems with the RM packet drivers, which has
caused my PC to hang. I have made a copy of the amiganos directory on
dir.mcc.ac.uk [130.88.200.4] as pub/amiga.

In general, I agree, however, there is an implication in

"As long as you are around to be the "control op""

that you are also monitoring what is being "said." At any rate,
it's your license, not mine.

I bought one at a local ARRL division convention recently. They are
manufactured by Tigertronics from the BayCom (a German packet club)
design. I use it with a TI laptop and Alinco DJ-580.

It works fine. The difference between this and a $100 TNC is that the
BayPac doesn't have an HDLC controller. It uses software in the PC to
simulate the HDLC chip. Because this puts heavy real-time requirements
on the PC, you won't be able to run it in Windows. It also won't work
with terminal programs that weren't designed for the BayCom-designed
modem.

>Where can I find the definitions of the KISS and RSPF protocols?

KISS is defined in some TNC handbooks, and was in one of the last issues
of Ham Radio Magazine. Basically it's AX.25 encapsulated in SLIP.

I wrote the RSPF spec. Version 2.1, with various partial
implementations floating around, and version 2.2, not yet in service,
can be found on UCSD.EDU, somewhere in the /hamradio tree. The v2.2
protocol spec is "rspf22p.txt". I think 2.1 is "rspf21.doc".

Good morning. It's Sunday the 22nd of November and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- The change of name from the London Wireless Society; latest news from the Pentland South Pole Expedition; special news for all RAE examiners: EMC and your licence: RLO for South Yorkshire - address correction.

Seventy years ago today, on the 22nd of November 1922 the name of the London Wireless Society was changed to the Radio Society of Great Britain.

This week the latest news from the South Pole is that Sir Ranulph Fiennes has rescued his companion Dr Michael Stroud from a deep crevasse a week after the start of their expedition to make the first unsupported crossing of Antarctica on foot. They are hoping to raise two Million Pounds for the Multiple Sclerosis Society. Reports received up to Wednesday the 18th stated that both men were safe and well as they continued across the dangerous crevassed area of the Filchner Ice Shelf. Conditions were dreadful however with driving snow and winds gusting up to 100 knots. They have now travelled 60 miles, to 79 degrees South and 43 degrees West, 20 miles further than the target they set for the first week. At the expedition's base camp Morag Howell, GM0MUV, is providing communications and will be on the amateur bands using the call VP8CME. The walkers aim to complete the 2,200 mile trek in just 100 days, dragging all their food and equipment on sleds weighing 420lbs each.

News now for RAE instructors:

HAREC stands for Harmonised Amateur Radio Examination Certificate. It is a mechanism which enables a radio amateur to obtain a permanent licence in the countries which have implemented the CEPT agreement (See the 1993 Callbook, page 71). At the moment the CEPT T/R 61-01 recommendation allows the issue of temporary reciprocal licences; a HAREC would take this a stage further and permit the issue of permanent licences. It is necessary to make sure that all amateurs in Europe have passed an examination which covers the same basic areas of study. To ensure that this happens all syllabuses have to be

harmonised. To this end there has been an Addendum to the City and Guilds RAE 7650 syllabus. Tt is in section 5, Transmitters. The Examination objective; the use of a valve as a power amplifier. Under Syllabus; Valves. Their application as RF power amplifiers, advantages and disadvantages. Please note that the assessment specification remains the same. In section 5 Transmitters there will still be only 8 questions.

EMC (Electro-magnetic compatibility) and your Licence.

The conditions of the Amateur Radio Licence A and B and the Amateur Radio Novice Licence A and B have been amended by the addition of a new paragraph. This paragraph has been added to Note 1 of the Notes to Terms, Provisions and Limitations Booklets BR68 and BR68a/N. The original proposed Radiocommunications Agency paragraph which was studied by the RSGB EMC Committee raised two main areas of concern. The first was that there was no mention of the fact that although "CE" marked equipment will comply with the new European immunity standards, it may still suffer breakthrough due to inadequate installation or incorrect servicing. The second concerned field strength. Although the EMC Committee acknowledges that circumstances may arise when it is necessary for an amateur to reduce the field strength generated by his or her station, it was not considered acceptable that any such reduction should be down to the levels set out in the relevant European immunity standards. Although these new immunity standards mean that "CE" marked equipment should have a moderate level of immunity, the level of immunity specified is relatively low compared to the field strengths which an amateur station may generate. The original paragraph did not mention the possibility of fitting filters or taking other steps to further improve the immunity of "CE" marked equipment. The EMC Committee produced an amended paragraph which was submitted to the R.A. As a result, the R.A. put forward a revised version which accommodates the spirit of the EMC Committee suggestions.

Last week we gave the wrong address for the new RLO for South Yorkshire, his correct address is; Alan Whitehead, G4JKW, Laburnum Cottage, 3 Darley Yard, Worsbrough Dale, Barnsley S70 4SB. Telephone 0226 299031

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.

First of all we must announce the death of Al Slater, G3FXB, on the 11th November last. He will be well known to all keen DXers and a full obituary will appear in a future issue of RadCom. From American Samoa, JA3JA and JA3JM/AA5K will sign as KH8/JA3JA and AA5K/AH8 from Sunday the 29th of November until Wednesday the 2nd of December, on all bands from 160 to 10 metres using CW, SSB and RTTY. From Belau, NJ1V and WV5S will sign KC6VV and KC6SS from Wednesday the 25th, to Tuesday the 1st of December, on 80 to 10 metres. From Barbados, K4BAI will sign 8P9HT from Tuesday the 24th to Tuesday the 1st of December. During the CQ WW Contest K4BAI will use the callsign 8P9Z. From Tasmania, the special callsign VI7AJT will be aired during November only, to commemorate the discovery of Van Diemen Land by Abel Janson Tasman some 350 years ago.

Rally news now and there are two events that we know of for today, Sunday, the 22nd:

The Bishop Auckland Radio Amateur Club's Radio and Computer Rally is being held at the Spennymoor Leisure Centre, Spennymoor, Co Durham. This is a new venue for this year's rally and is easy to find from the major routes through the area, such as the A1(M). There is ample parking space, refreshments and other amenities at the leisure centre.

The West Manchester Radio Club Winter Rally is being held at the Bolton Sports and Exhibition Centre, Silverwell Street, Bolton. Doors open at 11.00am, or 10.30 for disabled visitors. There will be trade and clubs stands and a bring and buy stall. Refreshments will be available.

A change now to a rally planned for next Saturday the 28th:

The Greater London Amateur Radio and Computer Show at Harrow, which was to have taken place next Saturday, the 28th of November has been cancelled.

There is one event that we know of for next Sunday, the 29th:

The Coulsdon ATS Bazaar will be held at the Headquarters of the 4th Purley Scout Group. Access to the site is via the public car park off Lion Green Road, Coulsdon. Doors open at 10.00am. There will be the usual trade stands and a flea market. Refreshments will be available. Talk-in will be on channel S22 by G4FUR/P. Further details can be obtained from G6HC, by telephoning 081 684 0610.

Contest news:

Next weekend the CQ World-wide DX CW Contest takes place from 0000 on Saturday the 28th, to 2400 on Sunday the 29th. All bands 160 to 10 metres will be used, excluding the WARC bands. See October RadCom page 19 for brief information.

and some UHF Contest news:

The next RSGB 432MHz Cumulative Contest takes place on Monday the 30th, between 2030 to 2300GMT. For further details on this event, see June RadCom page 65.

Special events

During next weekend, for three days, beginning on Saturday the Scottish Tourist Board Radio Amateur Expedition Group will be using the call sign GB6SA to celebrate St Andrews Day. Other International St Andrews Day stations on will be the St Petersburg Radio Club, callsign R1SA, the Aberdeen Amateur Radio Society using the callsign GB0ASP and the Moscow Radio Club. Further details from GM3MTH. Also during next weekend, Saturday the 28th and Sunday the 29th the Whitman Amateur Radio Club in Massachusetts, USA, will air the callsign WA1NPO. The station will operate from a site in Plimoth Plantation, near Boston. For further details, see November's RadCom, page 15.

And now the solar factual data

This week not all the data is to hand but for the period 9th to 12th November,

saw a small magnetic storm at high latitudes on the 9th, otherwise HF conditions remained good with no X or M flare activity reported. Sunspots have meaned at 106 and the solar flux averaged 131 units. The geomagnetic field has been unsettled all the period but was up to substorm levels at high latitudes with an Ap index of 33 units on the 9th, the period averaged an Ap index of 20 units. The state has been nil - nothing to report. The radio quality indices have been normal all the period except for the New York and Fort Collins Boulder circuits which were down to poor at times. The aa indices as supplied by the British Geological Survey for the period 3rd to 9th November gave a daily average of 31.5 nanoTeslas, with the sub storm on the 9th being up to 102 nanoTeslas about K5 during the afternoon period.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers as reported by Meudon averaged 11.7MHz, and the darkness hour lows 2.8MHz. There has been some other phenomena reported every day together with blanketing sporadic E on the 10th.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 9.7MHz and the darkness hour lows 2.4MHz. Magnetic disturbances can vary considerably, sometimes they affect the northern latitudes only and conversely at other times only the mid latitudes. Sometimes during severe storms all latitudes are affected including the Equatorial ring current, which due to the way the Earth rotates goes very negative and pulls the ionosphere apart.

And lastly the solar forecast:

This week, the active side of the sun will start to rotate away, magnetic activity may be unsettled up to the 25th but is then expected to become quiet. Solar flux levels are expected to be about the 150s, Ionospheric MUFs during daylight are expected to be around 30MHz, and darkness hour lows about 18MHz.

And that's the end of the solar information.

Finally in the main news, the licence issuing agency, SSL, has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 S R and G7 N W series, and Novice calls in the 20 A E and 21 B G series. .

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

Keywords: POP3, NOS, XTND XMIT

I am looking for a version of NOS that supports the extended POP3 command
set including the XTND XMIT command which can be used to send mail over a
POP3 connection rather than a SMTP connection.

Why?

When SMTP mail is sent through the computer running NOS, there is no
provision to check the identity of the computer that is sending the mail.
With POP3, since there is password verification, forgery of outgoing
messages can be much reduced.

I have just recently started reading this group just exactly what are the
"gateways to packet" ie how does one access them are they two way etc. Its
probably a FAQ but I can`t FTP
Cheers

>And what if a user has ports on two repeaters/subnets?

I <thought> that's what I was saying -- assuming a repeater, all the
stations using it would be on the same subnet. As mentioned later in my
posting, geography enters into the address assignment only to the extent
that the location of the <switch or server> determines the actual subnet
number. All users of that switch or server are in that subnet.

>>Subnets would be normally be assigned around switches or servers, and

>typing 'route add ' anything...

We treat different frequencies as different subnets, so if (as in my
area) you have a 2M freq and a UHF one, each is a distinct subnet and
multi-port users have a different address on each port. It works quite
well, though it means that such users also have multiple hostnames.

>aren't all all NOS nodes switches and servers ??

Not unless the owner offers services to the user community. I'm
talking primarily about switches that offer 24 hour routing to other
areas, but also about dedicated systems such as full-time routers, mail
servers, ftp sites, etc. In a connected network, the subnets would
be built around switches (and other servers would be part of the subnet
defined by the switch); in an unconnected one, using servers simply
provides a convenient geographical "center" for determining what subnet
number is assigned according to the geographical plan.

> How do you fix the 'hidden transmitter' problem ? Users 'homing' to a

>problem being solved ? I like the idea of two (one) 9K6 modem back to
>digital back replacing the audio stages of a UHF repeater (standard
>bandpass notch-reject type) triggered by a STATE-DCD in the modem.

I'm assuming that we take our networks as we find them. Hidden
transmitters are a problem no matter what address assignment scheme you
use. But FWIW, here in Dayton we <are> using a full-duplex repeater on
our 19.2kB UHF network to avoid this problem. It works very well.

I was not implying that local traffic on the subnet would be routed
through the switch (which would be less efficient than a digipeater),
but rather that the switch would offer a natural central point around
which the subnet would revolve. Users who can reach each other directly
would certainly do so. Ideally, the subnet would be small enough, or
would use a repeater, to ensure that everyone could hear everyone else.

That's the whole point -- SUBNETS SHOULD BE BASED ON CONNECTIVITY!!!
(sorry for shouting).

John

I am tring to get the ka9q package to work and am having problems. I compiled and installed the package. What i'm tring to do is test the connection between two pc's using the serial ports and slip. I attach the interfaces as stated in the manual and start all the services, but when I try to telnet to the other pc the connection is never made. What do I need to do in order to use this package. The two pc's are connected thru a null modem cable. I have pins 2 and 3 crossed as well as pins 4 and 5 and 8 and 20. Any help will be appreciated.

Thanks,

Allen

A friend of mine has recently passed his UK class B licence and is very
interested in Packet Radio. Knowing that I will shortly be sitting my
licence exams he suggested the idea that we built a TNC as he had heard
that there were some 'public domain' designs.

I would be grateful if anyone who has built their own TNC and is willing
to give me a few pointers on the best way to go forward would email me.

Many thanks,

Peter Green.

Multiple hostnames are not really necessary. If you check the appropriate RFC's the proper domain entry is:

Using my system as an example:

```
algedi.ampr.org     IN  A   44.24.101.45
                    IN  A   44.24.103.45
```

NOS handles this just fine.

This is a key point, keep the subnet small enough that the users have a good chance of hearing each other. Most of the time using a 4000+ foot hill for a simplex subnet is counter-productive.

Here in the Seattle area we've been lucky enough to enlist the support of USWest NewVector and obtain permission to use some of the Cellular radio sites. They have the same requirements for cell size that we do for subnet size. So far it would appear to be a near perfect marriage. :-)

>

     I was wondering if somebody could just give me some very annoyingly basic information about amateur packet radio. I'm interested in possibly setting myself on a network via radio. What kind of radio would I need, where would I get one/price one? I'm interested in relatively high-speed transfer, though,

if possible.

    Thanks much for any help you can give me.

That's interesting, and I'd never thought of it (I've never seen in in
any of the amprnet domain files I've seen). One question, though -- if
I am

```
foobar.ampr.org         IN   A    44.24.101.55
              IN   A    44.24.103.55
```

and I do "telnet algedi", which subnet is used? It seems this would
cause problems in areas where several users might be on both subnets;
that's much more likely to happen in the ham environment than on the
internet.

This is a CALL FOR VOTES for the creation of the rec.radio.info newsgroup. The RFD was first posted on 2 November 1992. It is decided that since discussion has stopped, showing support by acquiescence, that we will post the CFV prematurely with respect to the 30 days, typically, after the RFD group creation guidelines. The guidelines, however, state that the vote should be taken shortly after the end of discussion.

Voting will start on publication of this article and end on December 23, 1992 at 23:59 GMT. Votes should be mailed as follows(*):

Yes (create rec.radio.info, as proposed): QSL@unomaha.edu or qsl@unomaha.edu

No (do not create): QRT@unomaha.edu or qrt@unomaha.edu

Case is not important (at least on the receiving end).

(* Voting mailboxes are amateur radio Q-codes for mnemonic purposes.
QSL = acknowledged, also loosely yes or affirmative. QRT = cease transmission,
also loosely no, "nix" or "86").

Votes that are posted or mailed to me will not be counted. Message bodies will
be ignored for tallying purposes.

Moderator at creation will be mark@ve6mgs.ampr.org (Mark Gregory Salyzyn).
Regular posters to this group will be deputized to moderator status to
provide timeliness, reliability and to keep the load down on the chief
moderator. There is no archive site arranged at the moment, however,
Lyndon.Nerenberg@unbc.edu has offered a site once installed in the coming
month. Any offers to help moderate or archive this new group, if passed, can be
made to mark@ve6mgs.ampr.org, adec23.UUCP!mark or pschleck@cwis.unomaha.edu.

Votes will be acknowledged in followup CFVs in the newsgroups this CFV is
posted to. I must thank pschleck@cwis.unomaha.edu (Paul W. Schleck) for taking
on the task of being an independent vote taker and for his advice throughout
this process.

Please see the pertinent postings in news.answers and news.announce.newgroups
for the rules that will be followed in creating a newsgroup.

Newsgroup:
     rec.radio.info (moderated)

/usr/lib/news/newsgroups entry:
     rec.radio.info   Informational postings related to radio.

Charter:
     To provide high quality, informational postings about radio. This
     group will take cross-postings, or moderated postings from the regular
     discussion streams to alleviate the traffic, over expensive links, in
     these groups by allowing the news transfer mechanism to drop articles
     cross posted to rec.radio.info. Postings in the entire rec.radio.*
     hierarchy that the moderator(s) feel as informational, however, are
     likely candidates for cross posting or re-posting. Also by placing the
     informational postings in this group, make it easier for many to find
     radio related information.

     By maintaining a high level of quality in the postings, it is hoped
     that these postings may end up, at least more conveniently, in various
     archive sites, or possibly over the Amateur Radio Packet BBS network
     as well.

     By using a self-moderator scheme, the hopes are that many of the
     postings will maintain timeliness, and good propagation through the

computer networks.

Ciao, 73 de VE6MGS/Mark -sk-

I am attempting to setup TCP/IP in the Santa Cruz/Scotts Valley area
of Northern CA. I am seeking the IP coordinator to get an IP for my station.

If you are that person, or you know how to reach the IP coordinator, please
let me know.

To my knowledge there is no packet on the Santa Cruz "side" of the hills,
If there is a permenant TCP/IP presence, not just experimenting, please correct
me.

Thanks

In response to Steve Wright's post about the Gracilis Listserver, yes it
still exists. It's a quiet list but it has a fair number of subscribers.
The list may be subscribed to via e-mail to LISTSERV@KNUTH.MTSU.EDU with
an empty subject line and a message body (beginning in Column 1) with
the command:

SUBSCRIBE GRACILIS-L _your_name_here_

Our site should "throw the switch" to an online Internet link within a
matter of days (hours?), hopefully by Wednesday 25-Nov-92, 2230 UTC
(just before we close for the Thanksgiving holiday for two days). This
should transform the apparent sluggishness of a list formerly accessible
only when we polled out to UUnet 4-6 times daily, to a truly online
site. Posts to this list are addressed, in true-to-form Listserver
fashion, to GRACILIS-L@KNUTH.MTSU.EDU. Although I'm not the assigned
administrator of the list (it is unmoderated) I'm the one on campus full
time who both subscribes to it and can fix problems or answer questions
about our listserver. Hope this answers questions to all netters who
may not have contacted me directly but were wondering too! 73s.

 I have a G3RUH 9600 Bps Modem that I purschased at MFJ.. I had it at a
tower site and it got zapped by lighten. After checking out the board, I
come to find out I blew two Chips..

 U9 - ZN429E-8
U19 - ZN429E-8

 To the best of my knowledge, these chips are Antlog to Digital converts. I
am looking for a source other than MFJ & PacCOM for these chips.. Any help
Would be appreciated..

In our last committee meeting we were discussing a move to 9600 baud and
the 13cm band, One problem that we encountered was Does anyone make a
radio for use on 13cm and 9600baud. (either black-box or as a kit, anything
in fact)

Yup!, I have just bought one of these beasties, along with the Kantronics
9600 baud modem.

How compatible (incompatible) is the Kantronics 9600 board with the G3RUH
board for the TNC2.??

I have a PYE Olympic (UHF) which I intend using with the DE on 9600 and was
wondering whether there might be problems. I do know that the Olympic
works with the G3RUH modem quite well.

John.

Newsgroups: rec.radio.amateur.packet
Subject: 242KBps packet with the RDA-100/2 Data Transciver

Ive got some technical specs on an Proxim Inc RDA-100/2 Data Transciever. It operates as a part 15 spread spectrum device on 900-928 Mhz. HOWEVER, they mention that the radio may be placed out of band by setting a divider register appropriately (its synthesized). This could cause illegal operation, or in our case, operation in the 30cm ham band!

The radios are only 100mW, but one of my friends has a pair and a pair of amps (100mw->10W). I would like to get a group together to build a pair of drivers for them.

The devices supply 8 i/o pins and a few address pins (and an rf connection). There are a set of control registers and a data register. Basically the device generates an interrupt every byte.

Any ideas what is involved getting these to work on a 286 platform? Could it be as simple as wiring the data lines to the pc data bus (thru a 3-state buffer if necesary) and the address lines to the i/o addr lines on the PC bus. Even so, the thing goes awfully fast. Thus my attempt to seek some professional help.

My friend Derek paid $1K for a pair of these things, but in quantities of a few dozen they are willing to supply for $200-$300 each. Add $100 for a driver board kit and another $100 for an amp and this could be a lot better than the 56kb stuff that is currently state of the art.

Any volunteers?

I might be willing to supply a copy of the specs for a SASE, but that depends on how many replies I get.

Hello to all,

I just uploaded to ucsd.edu newest version of AX.25 driver for BAYCOM modem.
Shortly speaking it's a piece of software to interface NOS
to BAYCOM compatible modem. As usually the assembler source is appended.

November's release features the ability to raise UART IRQ
- I hope this will make the driver usable on XTs.
For example to use COM1 you may say: ax25 -I4p -B3f8
"p" after "-I4" means this IRQ is to be "prioritized"
- will get the highest priority in the system.

Special thanks to Bruce who responded to my queries about the problem
on comp.os.msdos.programmer group.

Pawel, SP9VRC

Side notice on related subject:

On request from Sweedish radio-amateur I wrote an asynchronous
packet radio driver for NOS. It makes frames of asynchronously sent
bytes (SLIP like) on the air thus is it _not_ compatible with any
existing (know to me) protocol. The only advantage of this aproach
is that you can make higher speeds on standard PC because the UART
is beeing used in a "right" way. If you are interested in this
topic let me know and I send you the driver for experiments.
If there is enough interest I upload the driver to ucsd.edu.
The driver it preliminary tested and seems to work somehow.
WARNING: using framing protocols others than HDLC/AX.25 may be ILLEGAL
in your country - you have to figure this out _yourself_.

I have seen references to MSYS systems which are used on computers,
to work with packet radio and provide land-line bbs service. I believe
this is the correct reference I have seen.

I would like to find out more about this system, as I'm currently
running a landline bbs and packet radio (tcp/ip); and would like to
connect them if possible.

Any help would be appreciated.

I'm considering setting up a weather node on my packet station and I'm looking
for recommendations. I found the Kantronics box and one other that I can't
remember (AES has it in its catalog). I'm wondering what folks are using
and what their feeling are on their equipment. I would like to log the typical
WX info (temp, barometer, wind speed & direction, etc.) to a computer for
future analysis as well.

Thanks in advance.

On a tangentially related note...
   Can AmigaNos (or any Nos derivative...) be used with Baycom or similiar modem?   That would save me mucho bucko$.   8-)

I have one report from someone who has succeeded in running BayCom in
Windows. The trick is to run the l2 TSR before starting Windows, and
run scc.exe from the Windows DOS box once Windows has started. This was
on a 386 system.

     Using DESQview, I am able to run (at work) Quattro Pro,
Paradox, WordPerfect and a file utility ... and Baycom ... on an
Artisoft Lantastic network. We are running 386/40s with 4 meg
of RAM.

     I have friends spending great gobs of money outfitting

their PCs with 16 meg of RAM and more hard disk space so they can run OS/2 to do the same danged thing. I have other friends that have about worn out their reset switches running Windows. Why do they do this to themselves?

I am now running, at home, Norton Editor, Procomm Plus, an MSYS PBBS and a Baycom to monitor a channel. This on a 386/40 with 4 meg of RAM.

Baycom runs fine under Desqview. At most, you can bump the keyboard conflict up a notch. It makes no never mind where L2 is loaded. I load it in a batch file in a small DOS window that I open for it. You can also load it before DESQview but why waste the memory.

73,
Steve

I have noted that there are software substitutes for a TNC available for the IBM-PC and compatibles, that can be used instead of a separate TNC. I would like to know whether this approach to packet radio is satisfactory. I am want to use my old Atari 1040ST as a packet terminal, and am interested in finding a PD software substitute for a TNC for use with this machine. Does such a thing exist, and has anyone any experience with it? What would then be an appropriate interface between the atari and my 2-meter rig? Your help and advice would be appreciated.

Please provide any appropriate feedback to my mailing address. I have posted a similar message on rec.radio.amateur.packet concerning the use of this computer for other amateur radio applications.

MacRATT Window Sizing Tip
by KD5VU 26-Nov-92

If you are running MacRATT with a large screen display, like the 13 inch color monitor, read on!

I have been having fits for months about semi screwed-up CTEXT and MTEXT displays. Some of the PC users stack their CTEXT messages by typing in spaces. Yes, I know the PK-232 manual suggest using the <Control-V> PASS command to inserting CRs in non-HOST mode CTEXT messages. The problem was the spaces were showing up in my Connection window. I resized the connection window back to MacRATT's default width and the problem is history.

If you are using a large screen display, be careful if you resize window widths.
^^^^^^
Who said you can't teach an old dog new tricks! Sure would like to hear from MacRATT users on other tips. Steve Fine's AEA MacRATT is a great program for all modes.

PktWin Version 1.1 is now ready.

I have uploaded PktWin to ftp.cica.indiana.edu. It is currently in /pub/pc/win3/uploads as PKTWIN11.ZIP.

It is an Amateur Radio Packet TNC controller program, and is shareware (25 pounds registration).

Paul

ARSENE Operations Planning

Joe Kasser, W3/G3ZCZ

The ARSENE satellite due for launch in the spring of 1993 is the next planned OSCAR. ARSENE carries a conventional AX.25 digipeater using frequency modulated (FM) uplinks and downlinks. There are only three differences between the ARSENE digipeater and a conventional terrestrial digipeater. These differences are as follows.

1. The device is cross band. You uplink to it on 70 cm and receive it on 2 m.
2. The device is moving, and will only be available for predictable but specific times of the day.
3. The link control parameters in YOUR TNC will have to be adjusted to cope with the time delay involved in the round trip from the ground to the spacecraft.

The digital transponder is a digipeater. There is no PBBS aboard. All users will have to contact stations (in real-time) directly via the orbiting digipeater to send them messages. Packet radio Bulletin Board System (PBBS) stations will have to contact other PBBS stations for message forwarding, individuals will contact each other, and they will all be digipeating through the same ARSENE spacecraft. Working through ARSENE will be similar to working through AMSAT-OSCAR (AO) 13, namely minimal Doppler, but some time delay on the signal. Received signal strengths however, are expected to be much stronger than those of AO-13.

Using ARSENE

ARSENE is going to be very easy to use especially for PBBS SYSOPs who are equipped for the 145 and 440 MHz bands. The ARSENE uplink is on 435.050, 435.100, 435.150 MHz, the downlink is on 145.975 MHz. You may use any of the uplink frequencies, they are all active in parallel. PBBS SYSOPS will be able to use conventional PBBS forwarding techniques for automatically passing messages over intercontinental distances. No software modifications will be required to an existing PBBS station to implement an ARSENE link. However, some software changes will make operations more efficient.

Hardware and software devices for pointing antennas at an OSCAR and following its motion are readily and inexpensively available. They can be operated in conjunction with, but separate from the PBBS software. The F6FBB PBBS software, for example, has OSCAR pass prediction software built in as a server.

This ease of access will probably encourage power VHF and UHF SYSOPs to add an ARSENE port to their stations. ARSENE will give them intercontinental forwarding capabilities without the licensing headaches of HF operation. Remember, unattended operation is legal on ARSENE's uplink and downlink frequencies.

The major problem from an operational aspect is that ARSENE is 10 years in the making and operates at 1200 bauds. If you look

at the packet channels in your local area, you will notice that certain ones are congested. If you live in densely populated areas you will certainly notice it. Have you copied a MIR packet pass lately? Look at all those disconnect replies from that spacecraft. Think of ARSENE's potential problem. It will be in range of not just your urban area, but of hundreds at a time. The potential for congestion could be worse than trying to get a packet through MIR.

Let's Plan to use ARSENE in an Optimal Manner

To get the maximum use of ARSENE we are going to have to use it in a planned or a controlled manner, not control access to the spacecraft itself. Access should be provided to the Roddy's of this world, namely, any suitable equipped individual who wants to send packets through it. PBBS message forwarding should be limited to designated PBBSs for intercontinental message forwarding. There is a precedent here in the closed HF nets which forward messages over long distances. If PBBS access to ARSENE can be limited in such a manner, the probability of the channel choking is lower than letting a free for all take place. This approach to message forwarding is an interesting alternative to the UoSAT low Earth orbit Gateway Store-and-Forward approach.

Individual Use of ARSENE

While some individual stations will leave their systems active via ARSENE all the time, the majority will not. Individuals will use ARSENE in two ways, non real-time message transfers and real-time keyboard to keyboard QSOs. They will probably come on-line on the frequency at local evenings and weekends. One way to optimize individual message transfers is for

stations to use the beacon to signal the presence of a message, and to use software such as LAN-LINK [1] to scan the contents of packets appearing on the frequency. The LAN-LINK approach works in the same way either for terrestrial links, or for the ARSENE link.

The LAN-LINK approach works in the following manner. As an individual LAN-LINK user, leave a message on your system. To ensure that people know that you have left a message for them a 'MAIL for' list is loaded into your Packet Beacon and transmitted every 30 minutes (Refer to the BTEXT command in the TNC manual) as ':QTC:' followed by a list of calls.

Should a station that receives such a beacon message, recognize its callsign, it will issue a connect request to the callsign of the LAN-LINK station that originated the beacon transmission. If the connect is made, the other station will send the message automatically which LAN-LINK will "capture to disk". The connect will time out and terminate a few minutes later. The only change the individual LAN-LINK user will have to do is set the packet UNP parameter to via ARSENE-1 (or whatever call sign the ARSENE digipeater uses).

Keyboard to keyboard contacts will proceed exactly as they do on terrestrial links, notwithstanding the QRM levels.

Upgrading PBBS Software for Using ARSENE

For PBBS message forwarding, a number of software changes comes to mind. These changes are modifications to the existing way of doing things, not a whole new approach. The changes are described below.

1. Modify the PBBS forwarding files to inhibit forwarding attempts with stations who do not have access to the satellite at that time.
2. Instead of having all stations try to transfer messages at the same time, as is done on HF, use a master-slave approach. This approach uses a master station that controls the transfer and will allow individual users time on the satellite. The Master station signals to each PBBS on the network when to start forwarding by sending it a token. The PBBS that receives the token initiates a forwarding cycle to each PBBS on the network in turn, then returns the token to the Master. The PBBS software modification is to add the master/slave token scheme. If the slave PBBS cannot return the token to the Master, it takes over as the Master. This situation will arise when the satellite has passed beyond the range of the previous Master station.

ARSENE and PacketClusters

ARSENE will also have the capability to link PacketClusters [2] around the world. PacketClusters are growing around the world and extending feelers along terrestrial links. For example, there are linked PacketCluster Nodes along the East Coast of the U.S.A, Northern Europe is linked into one gigantic cluster, and there is at least one in Japan. I recently saw a packet message that had come from England through the London - New York wormhole asking about a way to get into the local NY Packetcluster. Looks like the U.S.A. East Coast Nodes will be linked into the European PacketCluster Nodes within the near future.

The compatibility of ARSENE to current 2 meter 1200 baud packet will make it possible to link all the PacketClusters in a hemisphere. It may be that the motivation to provide real-time connections between stations on different LANs will come from the DX community rather than the message forwarding community.

Think about the following scenario. A DX-pedition sets up their hf equipment and a link to ARSENE. They connect to the PacketCluster system and the software starts working stations automatically on the active hf band by prompting via the ARSENE link. The ultimate in list operation. Fantastic? Yes, but almost within the state-of-the-art. Consider the changes needed to upgrade the current PacketCluster operation to the automated ARSENE link.

1. Modify the PacketCluster software to provide a broadcast link between Nodes. This could use the secondary header approach described for the PBBS above. If each Node uplinks a broadcast packet containing interlink information several times, until it copies its own packet on the downlink, there is a good probability that all Nodes copied the packet. The packets would be numbered so that fills may be requested.
2. Modify the PacketCluster to prompt each user when it is their turn.
3. Modify user programs that interface the user to the PacketCluster to hold a QSO when it is their turn. Using CW and any other digital mode such as RTTY, AMTOR or Packet, such modifications to software such as LAN-LINK is not difficult. The Kam with its dual link capability is an ideal

terminal unit for this task. SSB QSOs with voice recognition capability would be more difficult to achieve with current technology.

All the modifications to the way things are currently done, are upward compatible with the current way of doing things. Each, on their own offer an improvement over the way things are currently done. Together, they have the potential to change packet radio radically.

Sharing the Satellite

Individual users, PacketClusters and PBBS will all be sharing the satellite at the same time. To even up the odds of getting packets through, perhaps we can allocate one uplink channel to each class of user. This approach ensures, that competition for the transponder in each class of user is limited to the particular class. The following spectrum allocation for the ARSENE Uplink is suggested.

PacketClusters 435.050 MHz
Individual Users 435.100 MHz
PBBS forwarding 435.150 MHz.

Summary

ARSENE can provide an interesting addition to packet radio if we don't choke it at birth. Think about ARSENE, and plan for its optimal use. At the same time, you might care to speculate on how different packet radio would be today, if the RUDAK packet radio PBBS on AO-13 had worked. This article has made some suggestions for optimizing the use of the ARSENE digipeater.

I repeat, "were you there?". If so, than you can say that "yes, he received used equipment". If not, then you are basing your comments on hearsay. I tend to agree with Raul at Jun's since I go in there frequently.

I have on several occasions bought both new and used equipment from Jun's. I have never had a piece of equipment misrepresented as new.

I you haven't deleted it already, re-read Axels original whine-o-gram about Jun's Electronics and the followup posting from Jun's describing the transaction. Someone is distorting the facts. I seriously doubt that it is Jun's doing the distortion.

Sender: usenet@gate.demon.co.uk

Good morning. It's Sunday the 29th of November and here is the GB2RS news broadcast, prepared by the Radio Society of Great Britain.

First the headlines:- A review of the Novice Licence scheme has been completed; the RSGB AGM is next weekend; comments are requested on a code-free HF licence; and we have the latest news of the South Pole expedition.

At a tripartite meeting held between the RSGB, the RA and the City and Guilds the first year of the Novice Licence scheme has been reviewed. The RA felt that in general the scheme had been a success and that only minor modifications were required. The high operating standard of Novices was a testimony to the effectiveness of the practical element in the RSGB's training scheme.

Some minor changes to the examination syllabus were agreed and some small extensions to the band plan were proposed. It was, however, felt that Novices should not have access to the two metre band as this provided the best incentive for them to upgrade to a full B licence. No changes are to be made to the power levels. A full report will be published in the January edition of Radio Communication.

The latest information on the Pentland South Pole Expedition is that Sir Ranulph Feinnes and Dr Mike Stroud have now walked 138 miles, well ahead of schedule. The intrepid pair have had one day's rest so far, when winds peaked 120 knots. Their position on Tuesday night was 80 degrees 19 minutes South, 41 degrees 50 minutes West. Using their Yaesu FT70G transceivers, running 10W to a dipole, they have been in direct communication with Lawrence Howell, GM4DMA, at his home station in Aberdeen.

We learned this week that Morag, GM0MUV/VP8, had not reached her base station at Patriot Hill until last Tuesday. Previously she was photographing Ran and Mike at Gould Bay, and had been held up by bad weather. By now she is expected to have erected some large antennas and should be fully operational.

Last week's GB2RS was relayed to the expedition by GM4DMA and we understand that Morag was delighted we were following progress. In anticipation of this week's bulletin reaching the South Pole, we would like to extend our best wishes to Morag, Ran and Mike.

RSGB members are reminded that the Annual General Meeting for 1992 will take place at the Royal Society of Chemistry Scientific Societies Lecture Theatre, next Saturday the 5th of December. The December edition of

Radio Communication, which was posted to all members last week, contains further details about the AGM and a street map of the venue. Members are reminded that Ballot papers for the Council election must be received at RSGB Headquarters by 12 noon tomorrow, Monday the 30th of November.

The December edition of Radio Communication contains a request for views on having a UK class of HF amateur licence which does not require a Morse qualification. Comments should be sent to: The RSGB HF Committee via RSGB HQ, Lambda house, Cranborne Road, Potters Bar, Herts EN6 3JE.

The UHF Voice repeater GB3ER near Chelmsford, Essex, has now been restored to service on a new channel, RB3. The repeater group would appreciate any signal reports, comments, etc. For further information contact G1FOA, whose address is correct in the RSGB Call Book.

Now some items of HF DX news from the weekly RSGB DX News Sheet which is edited by Brendan McCartney, G4DYO.

From Belau, NJ1V and WV5S will sign KC6VV and KC6SS from now, until Tuesday the 1st of December, on 80 to 10 metres.

From Uganda, DJ5RT will sign 5X5WR from Wednesday the 2nd to Thursday the 10th of December.

From Martinique, FB1MUX will sign FM2GO until Monday the 7th of December. This is the first use of the FM2 prefix.

From Barbados, K4BAI will sign 8P9HT, until next Tuesday the 1st.

Rally news:
There is one event that we know of for today, Sunday the 29th:

The Coulsdon ATS Bazaar is being held at the Headquarters of the 4th Purley Scout Group. Access to the site is via the public car park off Lion Green Road, Coulsdon. Doors open at 10.00am. There will be the usual trade stands and a flea market. Refreshments will be available. Talk-in is to be on channel S22 by G4FUR/P.

We know of no rally scheduled for next weekend, Saturday the 5th and Sunday the 6th of December.

Now a date for your diary:

Next year the RSGB's National Amateur Radio Exhibition will be held at Birmingham's National Exhibition Centre, on one day only: Sunday the 16th of May. It will coincide with the National Vintage Communications Fair.

Contest news next:

During this weekend, the 28th and 29th, the CQ World-wide DX CW Contest takes place. It started at 0000 on Saturday, and will finish at 2400 today. All bands 160 to 10 metres will be used, excluding the WARC bands. See October RadCom page 19 for brief information.

During next weekend the ARRL 160 metre DX contest take place from 2200 on Saturday the 5th, to 1600 on Sunday the 6th of December.

Next Sunday the 6th of December there is the Independent Finland 75 year Anniversary Contest, from 0000 to 2400. All bands 80 to 10 metres will be used, excluding the WARC bands, on CW and SSB. See December's RadCom page 15 for further information.

Now the VHF to SHF Contest news:

The next RSGB 432MHz Cumulative Contest takes place tomorrow, Monday the 30th, between 2030 to 2300GMT. For further details on this event, see June RadCom page 65.

The RSGB 144MHz AFS Fixed and SWL Contest takes place next Sunday the 6th, from 0900 to 1700GMT. See July RadCom for further details.

And on Monday the 7th, the fifth and final leg of the RSGB's 1.3 and 2.3GHz Cumulative Contest takes place between 2030 to 2300GMT. See June RadCom for details.

And now the solar factual data:

This week we have caught up with last week's missing data. The extended period 13th to 22nd November has seen 3 small M flares the largest being an M1.6/2N on the 22nd. Ionospheric conditions have generally been good. Sunspot counts have meaned about the 122s, but steadily rose during the period from 63 on the 13th up to 146 by the 20th. Solar flux levels also increased and averaged 148 units, the highest level since last July.

The geomagnetic Ap index dropped from unsettled down to quiet levels and averaged 11 units for the period. The state has been nil, nothing to report, throughout the period.

The radio quality indices rose from a little below normal up to very good conditions, well above normal, the 18th was an excellent day on all circuits except for the Fort Collins Boulder one.

The aa indices as supplied by the British Geological Survey for the period 10th to 16th November have been quiet, with the daily averages being only 27.6 nanoTeslas, with some very quiet periods being down to only 8 nanoTeslas.

Now the ionospheric data for Central France:

The F2 daytime critical frequencies at Poitiers, as reported by Meudon, averaged 10.9MHz with peak times being centred around 1100 hours. The darkness hour lows averaged 3.3MHz and were centred around 0600 hours. There was a small amount of other phenomena and spread F particularly on the 17th.

Now the ionospheric data for the north:

The F2 daytime critical frequencies at Ekaterinberg averaged 10MHz and the darkness hour lows 2.7MHz. A comparison between the ionospheric levels of Poitiers in central France (North 46) and Ekaterinberg, 10 degrees further North, shows that at present the daylight levels for Poitiers are about 1MHz higher but the darkness hour levels are 1.5MHz higher.

And lastly the solar forecast:

This week the quieter side of the sun will be coming into view, solar flux levels are expected to be about the 135s. Geomagnetic levels are expected to be just unsettled. Ionospheric MUFs during daylight should reach 30MHz on north/south paths, with darkness hour lows good up to 18MHz.

And that is the end of the solar information.

Finally in the main news, SSL has informed the Society that as of last Wednesday morning, the latest callsigns issued were in the G0 Sierra Romeo and G7 November X-ray series, and Novice calls in the 2 0 Alpha Echo and 2 1 Bravo Hotel series.

You're listening to GB2RS, the news broadcasting service of the Radio Society of Great Britain, transmitting in the 80, 40, 6 and 2 metre bands.

I boutght one and it came with the Baycom 1.4 software. It works fine.
Yesterday I tried version 1.5a on it and it works very well also.

I am using it with an old pc xt (Phillips). The disadvantage of this setup is
that you have to leave the pc on all time if you want to receive mail.
Clem.

Yeah i went ahead and bought one, and I love it! Its the first time I got
to see packet in effect, and its great..

I have two questions though:

1) Where did you get BayCom 1.5a?

2) Is it possible to transfer ASCII or Binary files over packet with BayCom?

  Thanks.

Subject: Ham, PC user wishes to mix two together
Lines: 16

My father, very rapidly approaching retirement, has mentioned a desire
to tie together two of his interests, microcomputers and ham radio.
He's been in computers most of his professional life, and he's picked up
ham radio again in the past few years after years of inactivity.

Is there some packet radio FAQ I should print and send to him a
retirement present? Or is there a bible I should buy and send him? How
do I help him get started in this?

(If any of you are from Marin and recognize my last name, yes, I'm

talking about Bob.)

Thanks,
Nick

John,

We have exactly that situation here on our local ip network. We have seven different lans with many local users multiported on them.

I think your question can be better answered by the following. It's an excerpt from a message posted on our local 'seatcp' mailing list by Don Sandstrom (kg7cp) in response to a question by Terry (n6ry) about a routing problem he was experiencing.

--------------------------Start--
Terry - I have worked through exactly the same problem myself and there is a solution. On studying the domain resolver code in nos, while in the process of fixing aspects of the domain nameserver code, I found out how nos handles multiple ip addresses belonging to the same hostname.

First nos generates a list of the ip addresses associated with the given hostname. Then it looks at the route table and determines which route would be used for each of the ip addresses. Then it picks the route that has the lowest metric. The metric is the value shown on your display in response to the >route command.

This means that in a static routing environment, you can control which ip address is chosen by controlling/setting the metrics for all your routes. This is possible with an additional parameter in the route add statement; it follows the <gateway> parameter in the statement. If your route does not have a gateway, you can insert the keyword "direct" as a placeholder, and then follow with your metric.

For example, suppose I want a route to n6ry via wa7tai with metric 0:

route add [44.24.101.69] ax1 [44.24.106.36] 0

or a route direct to w7oiv on southlan with metric 1

route add [44.24.100.109] ax0 direct 1

Route statements involving subnets also accept the metric parameter.

Now the trick is to set up all your "routine" routes to have a metric of one (1) or greater, so that you can specify specific individual routes to have zero (0) hence be lower and hence force the selection of the corresponding ip address. In other words, if your route to [44.24.101.0]/24 is metric 1, and you have a route to kd7nm's 220 port, [44.24.103.10]/32, with metric 0, nos will generate packets for kd7nm.ampr.org. addressed to [44.24.103.10] because the corresponding route has a lower metric.
---------------------------END--

Dons response came at a time when we were not running any routing protocol between the various routers. We had been running RSPF but decided to scrap it for the time being and go with either static routes or RIP. We are now

in the process of configuring the system to run RIP which should automatically give us reasonable metrics for the various routes.

I hope this helps answer your question. If you have any more, feel free to ask. We're still discovering the answers to some of this ourselves but are more then happy to pass on what we have learned.

73, Ken N7IPB

I should point out that I specifically designed my code to eliminate
virtually every reason to assign more than one IP address to a host.
The flexible mask-per-entry routing table format, with the ability to
specify interfaces by name instead of IP address, makes almost any
topology possible without having to assign more than one IP address
per node.

Nevertheless, my code ought to handle hosts with multiple addresses
in a fashion closer to that specified by the Internet Hosts Requirements
docs. The "look at the routing table" trick just mentioned must have
been added by someone else; I wasn't aware of it, although I haven't
been tracking the other versions of NOS for some time. I guess it's
an effective hack, although it definitely does violate layering.

I've had what I think is a better idea on the back burner for some
time, which is to create an alternative connect() call to TCP that
allows the caller to specify a list of IP addresses, instead of just
one. TCP will cycle through each address sending SYN segments until it
gets an answer; the IP address on the first answer is then used for the rest
of the connection.

We have a special case where different IP addresses per interface
is convienent. We have a server with low speed ports on more than
one LAN. It's convienent to assign an address from each LAN's block
to the server rather than entering exceptions in everyone's tables.

Of course the server could simply stay on one LAN and let the switches
and the high speed backbone handle things. But this is our main mail
server and we wanted redundancy for the times when the backbone is
down. We'd rather it straddle LANs than have our users start frequency
hopping. It's taken us a long time to convince the users to stay put
on their LAN frequency.

Phil, not a challenge to the above but a question: we have two subnets
in the same area, one on vhf ([44.70.12.0]/25) and one on uhf
([44.70.12.128]/25). If you have only a single switch between the two
subnets the routing wouldn't be too bad, but how would you configure routing
for multiple users who have interfaces on both subnets? Wouldn't this
require a lot of one-host routing statements in everyone's autoexec file?

I LIKE that idea. A concept I threw out to the tcp list a while ago was
to have the arp table include a field for the last interface on which a
given host was heard. That would be the first one to try the next time
you needed to reach that host. The idea wasn't met with much
enthusiasm, I think because it violates layering (does it?), but it
stuck me as a reasonable way to deal with multi-port users.

John

Phil,
 Your code is undoubtedly the most flexible around. However, the biggest
reason to assign multiple IP addresses to a single hsot is that
many (most?) other tcp/ip implementations can't handle a 'local' address
that isn't in the same IP subnet.
 I have a LAN at home and at work with hosts that mandate my rf routers
use multiple IP addresses, to make sense of things.

Cheers,
 Willis n5szf

2 questions.

Is the source for any of the X1? TheNET versions available??
Is it possible that the bank switching method used on the TNC-2 to run
this could also be used on the TNC-1??

Dear Paul,

 Thanks for the new version. My problem however is this. When I ran Pktwin.exe
from Program Manager or File Manger i get a "This program runs under Windows"
error message. I don't know why Windows thinks this is a dos app.

I also checked to make sure that I had all the proper files. Well I hope to
solve this problem soon.

73's
Ben N2IRA

If I know the names of the machines that I want to send someone a note
through, can I send it to an internet address and have it bridged over to
packet? Or is there a way for someone on packet to send me a message on the
internet?

John

I have been running THEnet X1G for about a month now as a remote node on the
local mountain. We quickly discovered that more than a couple of users in
talk mode could significantly slow down the standard PACOMM Tiny-2 tnc we are
using. A few days later we upgraded the tnc to 10mhz (cpu) operation and have
been getting rave reviews since.

The only problem that I have been having is with the NETROM route broadcasts.
For some reason the node is either not broadcasting its netrom node routes at
all or is not broadcasting them correctly. It appears that for some reason
only netrom route it is broadcasting is it own. This is somewhat of a problem
the node provides the only wide area access from the local BBS.

I have looked at the parms and mode setting and with little exception (txdelay)
everything is set to defaults. In particular the initial obselence count and
mminimum broadcast obselence are set to 7 and 5 respectively. I did try
setting
the initial obselence count to 10 but it did not seem to make any difference.
When I issue the routes command the node returns:

```
> 0 CULBBS:KD4PWU-8 10 1
  0     NK:N4DDL-3  10 1
  0  IPZIV:K4ZIV-8  10 1
```

If everything was working correctly I would expect the node to broadcast all three of these routes and my bbs would thus know the NETROM route to K4ZIV-8. In addition, the node N4DDL-3 should learn the NETROM route to KD4PWU-8.

If N4DDL-3 does not learn about KD4PWU-8, I don't get mail or other bbs traffic.

If anyone can help me figure this problem out I would greatly appreciate the assistance.

Also, if anyone can point me to an ftp site for X1J I would appreciate the pointer.

Approved: tale@uunet.uu.net
Message-ID: <1fgbp4INNllg@news.UU.NET>
NNTP-Posting-Host: news.uu.net

This is a 2nd CALL FOR VOTES for the creation of the rec.radio.info newsgroup. At the end of this article is a list of blind tallies, acknowledging the reception of your votes. If you are not in the list, and have sent in a vote, please resend your vote. The RFD was first posted on 28 October 1992, and the original CFV was posted on 23 November 1992.

Voting has started, and will end on December 23, 1992 at 23:59 GMT. Votes should be mailed as follows(*):

Yes (create rec.radio.info, as proposed): QSL@unomaha.edu or qsl@unomaha.edu

No (do not create):   QRT@unomaha.edu or qrt@unomaha.edu

Case is not important (at least on the receiving end).

(* Voting mailboxes are amateur radio Q-codes for mnemonic purposes. QSL = acknowledged, also loosely yes or affirmative. QRT = cease transmission, also loosely no, "nix" or "86").

Votes that are posted or mailed to me will not be counted. Message bodies will be ignored for tallying purposes.

Moderator at creation will be mark@ve6mgs.ampr.org (Mark Gregory Salyzyn) using the address rec-radio-info@ve6mgs.ampr.ab.ca. Regular posters to this group will be deputized to moderator status to provide timeliness, reliability and to keep the load down on the chief moderator. There is no archive site arranged at the moment, however, Lyndon.Nerenberg@unbc.edu has offered a site once installed in the coming month. We also need a BITNET Listserver gateway if anyone is interested in supplying. Any offers to help moderate or archive this new group, if passed, can be made to mark@ve6mgs.ampr.org, adec23.UUCP!mark or pschleck@cwis.unomaha.edu.

Please see the pertinent postings in news.answers and news.announce.newgroups for the rules that will be followed in creating a newsgroup.

------- Charter --------
Newsgroup:
     rec.radio.info (moderated)

/usr/lib/news/newsgroups entry:
     rec.radio.info   Informational postings related to radio.

Charter:
     To provide high quality, informational postings about radio. This
     group will take cross-postings, or moderated postings from the regular

discussion streams to alleviate the traffic, over expensive links, in these groups by allowing the news transfer mechanism to drop articles cross posted to rec.radio.info. Postings in the entire rec.radio.* hierarchy that the moderator(s) feel as informational, however, are likely candidates for cross posting or re-posting. Also by placing the informational postings in this group, make it easier for many to find radio related information.

By maintaining a high level of quality in the postings, it is hoped that these postings may end up, at least more conveniently, in various archive sites, or possibly over the Amateur Radio Packet BBS network as well.

By using a self-moderator scheme, the hopes are that many of the postings will maintain timeliness, and good propagation through the computer networks.

-------- Blind Tally, vote acknowledgements -------

From: Paul W Schleck KD3FU <pschleck@cwis.unomaha.edu>

There should be 113 unique votes here. ...

73, Paul, KD3FU

I have a PK232 MBX which I am now operating using FSK as well as
AFSK to drive a TS 690S via the ACC2. It works well on both modes.
I now have a question about improving the reception abilities of
the 232 using a 170 Hz shift filter system outside of the 232. I
was once told that you could put a 170 Hz filter in an audio line
entering the 232 through the mono jack rather than the 5 pin plug
used for radio port 1 or 2. Is this audio input the one which accepts
TTL signals? And if so - where could I find a good schematic for a
170 Hz shift filter which could use stock or second hand cw filters.
I am told that this type of filter addition to the 232 sig. improves
the reception performance of the 232.

Please note that due to the low Canadian dollar,
duty etc I am holding back on purchasing the digital
filter unit recently described in QST - althougth
it appears to be the " Best Solution".

Please E-mail me direct if you are able to help provide direction as
to where I might find the schematic for the audio filter with a 170 Hz
audio freq. shift between tones. Thankyou for any help you might be
able to provide me.

After getting frustrated at a lack of packet connection documentation on my
new ICOM IC-2SRA 2 meter handheld, and getting no help from my local
dealer, I called ICOM.

ICOM technical support at (206) 454-7619 will fax/send a schematic and
parts list (with Radio Shack part numbers) for those wanting to connect the
newer ICOM HTs with a combined microphone/speaker plug into a TNC packet or
similar system.

Basically, it's one miniature stereo plug, 33k 1/4 watt resistor, and a
small value capacitor as far as parts are concerned.

ICOM had the information on my fax before we hung up.

Regards,

P.S. Be prepared to stay on hold for up to 5 minutes before they can get
to you.

JBL.... the software MacRatt is NOT freeware or shareware. It is a real
coomercial product offered by AEA. I have seen it offered by the usual ham
radio commercial dealers... HRO and all of the others. Steve Fine wrote the
program... not sure what the latest release is or whether there has been any
new versions or changes since the program was released a couple of years
back.

Check
out the dealers or call AEA for more info I guess.

The "#" is the seperator that indicates the ARRL Section follows. So here in
EMASS my packet address looks like:
KA8SCP@WA1PHY.#EMA.MA.USA.NA

You probably have figured out the rest. Don't know whether it is redundent in
your case where all of NH is one section. Anyone else like to clarify that?

73 for now.... c u on the shortwaves

Could someone please tell me who the Connecticut Cord. for the TCP/IP
network. I would like to get an address.

-Nick KA1NIP

I'm running OS/2 on 2 different machines, and would like to tie them
together via a 56K packet link. What protocol is used is irrelevant, as
it will be only point to point.

The primary function will be for file transfer, and these are all custom
written programs; however, if I can get the system to present the remote
system as a logical drive, that would be preferred.

As the systems are only a couple of hundred feet apart, putting a 10 GHz
link under Arcnet is not out of the question. Anyone try this?

Help!!!

MacRATT is from AEA that produce the PK-88 and PK-232. MacRATT is
a very good packet program with lots of nice features. Some of the
more advanced features only work with AEA products, but the program
still works very nicely with non-AEA TNCs. It is a commerical product
and goes for 69.00

It will run on a 512KE but not a 512K, sorry.

I'm thinking of getting into packet radio and I've been eyeing the KPC-3 because of it's small size and low power consumption. Are there any features I should be looking for in a TNC?

Thanks,

Dan N2PKE

A problem has arisen at this location when trying to use TheNET X1H.

ARP and IP router functions either don't respond or respond with packets that contain binary trash. PING to the router also fails.

Tests with X1G work correctly. All nodes involved in the test have

parameters identical to those used with the X1H firmware when it
failed.

Are there possibly some parameter settings that need to be examined
or changed to make things function properly that weren't mentioned in
the documentation? Has anyone else experienced similar problems?

Software used includes an 286 MSYS 1.13 node, a 386 and a Sun 4/75
running GRI 1.7j.

I am having trouble loading the DEPCA Clarkson Driver. I can execute it
and it returns the address that it was loaded to, but NOS gives an error
that there is no packet driver loaded at the given interupt. I have also
checked it with the pktchk.com utility that comes with the DRIVERS.ZIP file
and it returns a message stating that no driver was found. The
MANIFEST.DOC states there should be a file in the .ZIP called DEPCA.NOT
that has notes as to compatability with various DEPCA cards but this
file was not included with what I received. I got the DRIVERS.ZIP file
from one of the SIMTEL mirror sites. Any help would be greatly appreciated.

> Why do they do this to themselves?

Don't know about those running Windows, but I can tell you you wouldn't
be asking about OS/2 if you had tried it.

Imagine this:

  The handholding of Windows for those who want it, plus:

  The ability to multitask DOS programs much like Desqview, but
     without the preformance penalty that Desqview has, plus

  "Crash protection" -- if one task crashes, it does _not_ bring down the
     entire system, plus:

  The ability for one task to start another (VERY useful), plus:

  A true 32 bit operating system for 32 bit machines.

You have just imagined OS/2 2.

  True, OS/2 does require more resources than MS-DOS does, but then, OS/2
does more than MS-DOS. The term DOS is an acronym for Disk Operating
System; which means that it's little more than a device driver for the
disk system. Back when computer systems had only 64K of memory, the
ability to have the DOS use 4K was paramount. Now, when 8 meg costs as

much (if not less) than 64K did back then, the amount of space taken by
the operating system isn't as critical.

Besides, you haven't seen resource demands until you've seen Windows NT.

Initially I was going to say:

Apologies for playing the ploiceman but the protocol isn't irrelevant.
One of the (slightly silly IMHO) rules from the FCC is all packet work
MUST use AX25 as the link layer on the air. Its a shame because doing
what you suggest is kindof interesting!

But I read part 97 again and changed my mind!

Rereading the relevant section 97.109(e) my reading of it seems to ONLY
pertain to "automatically controlled" stations, that is stations
retransmitting third party communications without a control operator
being present. If both ends of the link have a control op and are not
retransmitting third-party communications, then its allowed. So do it!
And don't ask the FCC for calrification (they make some stupid decision!).

But beware of your bandwidth (if these things are running at 10Mbps).

Let me know how it works.

Comments?

 S,V> From: SEELER@upei.CA (SEELER@UPEI.CA , VY2DCS)
 S,V> Newsgroups: rec.radio.amateur.packet

 S,V> I have a PK232 MBX which I am now operating using FSK as well as
 S,V> AFSK to drive a TS 690S via the ACC2. It works well on both modes.
 S,V> I now have a question about improving the reception abilities of
 S,V> the 232 using a 170 Hz shift filter system outside of the 232. I
 S,V> was once told that you could put a 170 Hz filter in an audio line

The place to filter the PK232 is in its own internal passband filters and AEA has a Mod kit available (no charge) request AMtor Kit. It changes the passband of the PK232. You might also refer to the RTTY Journal November 1992 issue for some further details of improving the PK232.

If you are optimizing for 170 Hz Baudot then you will eliminating some capability of the other modes and in particular packet. The PK232 is also a 200 Hz shift device.

I have used and compared external units to the PK232. You can add a complete seperate terminal unit and drive it quite well. Currently we use the Dovetron which regens RTTY and feeds the PK232.

IF filtration in the radio is what helps more than anything else. I use 250 Hz CW filters in the Icom 751 which great luck on RTTY. On Amtor they are a bit to narrow. 500 Hz seem to perform better.

The PK232 works quite well with narrow CW filters and with the Amtor mod I can't find much difference when compared to a ST-6000 Hal Unit which was optimized by Hal Communications as a test standard at 45 baud and 170 Hz. The Hal copies the real weak polar signals slightly better.

 D> should be looking for in a TNC?

Sure I think upward 9600 compatability and price. The 3 has a good price and is
a foxy unit and I don't know about its ability to use the standard header and
go up in speed.

Does anyone have a map of all the packet digipeaters and packet bbs nets?
Something wall size, or even jut a piece of paper.. This would definetly be
useful..

I have been hearing some interesting things on the HF bands over the last
few weeks. It sounds sort of like a cross between packet and AMTOR. This
reminded me of PACTOR discussions I heard some time ago.

I have the following questions:
1) Was this PACTOR?

2) Have any of the companies decided to add support for PACTOR
(AEA, KANTRONICS, etc.)?

Thanks in advance,

Phil

Hello,   Im very interested in some information on packet radio. In
particular, gateways into the Internet and satellites in Southern
California. Any information would be welcome. Thanks !

Nick, The tcpip coordinator for CT is Jon Bloom, KE3Z. He works for the
ARRL in Newington. Suggest you call him there. If by chance you're in
northern CT, try Brian, ka1jy. Our state has two subnets at present, so
there are two coordinators. If you need further information please ask.

I run a tcpip voice discussion net every Tuesday night on the Port
Jefferson, LI repeater, 145.15 -.600 (no pl during net time) which is
also carried on k1dr/r 146.475 + 1.00 w/100Hz tone. K1dr/r is in New
Canaan, CT. Both repeaters have excellent coverage. Perhaps you might
want to stop by some Tuesday night (at 8:00pm).

73
Jess ND1L   44.88.0.21 (tcpip) or nd1l@kcdfd.ny (ax25)

  Well, since you have some knowledge of Packet Radio, is it possible for you
  to tell me if there are any files out there that discuss packet. I would
  like them to be ftpable.

You can get the 1.5a software via ftp at:

Host ucsd.edu

    Location: /hamradio/packet
      DIRECTORY drwxr-xr-x   512 Dec 25 17:38 baycom

The file transfer function in the baycom is not compatible with the xmodem or yapp
or other protocols used in the BBS in our area. In the baycom doc, they say it
will
do file transfer with bbs running Baycom software...? (none around here...)

    I recently heard about a Packet Controller sold by Ramsey Electronics
in Victor NY. The price of this item seems very reasonable. I called
the company and after talking with a Technician there, found that it was
little more than a MODEM that connects between the PC's serial port and
the radio in/out puts. It also comes with software to do all the packet
related things so the computer is doing the packet work instead of a TNC.
This sounds pretty good to me. I wonder if any else has tried this device.
If so:

- How does it work?
- Does it support anything other than 1200 Baud?
- Will it work with any of the TCP/IP programs like NET or NOS?
